Do you think grapes would grow good this far north? I have a side hill, sandy loam soil. It is not a steep hill, slopes to northwest. About one acre in it. It is in timothy and clover now. Would you tell me what you think about my setting this to grapes and what kind; time to set; how to prepare soil and cost of plants? How soon after planting will grape vines give fruit?

Minnesota.

H. A. Westcott.

The Betha grape is hardy far north of your place. You can safely plant this variety. Set vines in the spring. A grape vine will bear a good crop three years from planting. Plow land well, disk and harrow, then set vines eight feet apart in rows, with rows ten feet apart. You can secure vines of your state nurserymen, who will give you prices on quantity you desire.

* * *

On my farm are three fine English Walnut trees all in a clump, probably twenty years' old, and in fine, thrifty condition, with body diameter of 16 to 18 inches. They do not bear and are probably seedlings though I do not know.

Is there any thing I can do to make them fruit that you can suggest that is worth the trying?

West Virginia.

C. L. Shaver.

Although seedlings, these trees should bear nuts. Do they bloom? If so, it would seem that the nuts do not set because of injury from insects. Try spraying them with arsenate of lead and black leaf 40. If they do not bloom top work them to a standard variety of the English walnut. You can get scions from the Rochester, N. Y., nurserymen. Or you may be able to get the scions from bearing trees near your home.

* * *

I have recently purchased two acres of land just outside of the city limits and intending building me a home on it and also devoting the additional space to poultry and fruit. I have had seven years' experience in poultry in a small way, you might say as a back lot proposition, and have always come out ahead with my poultry, as I breed nothing but thoroughbred stock, if only in a small way.

Would you be so kind as to tell me what variety of apples, peaches, cherries and grapes are suitable for this climate. The soil is a

Successful Poultry Culture

Treats on all subjects appertaining to the poultry business. The chapter telling how to save three-fourths of your feed bills is alone worth many times the price of the book, 128 pages, profusely illustrated. Price 50 cents. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

good, strong red clay soil that produces most anything. While I read everyone of your articles in the Journal and even in the last one I notice what seems to be your favorite in the way of fruit, still I was not sure that you might not suggest a different sort for this climate, hence my reason for bothering you. Kentucky. R. E. Reynolds.

I like that letter. Here is determination and hope of future success—and right conditions, with the right kind of people, evidently.

I would plant Golden Delicious, Delicious and Stayman apple trees were I to put out a commercial orchard on Mr. Reynold's land. Would make the orchard one-half Delicious.

In peaches would make the planting of Early Elberta and J. H. Hale. The Montmorency cherry is far the most profitable variety to plant commercially. The Concord grape will give you the largest financial returns.

* * *

I have been negotiating for a five acre tract of land in the city limits of Washburn, Bay-

field County, Wis., and intend to move there in about 60 days. I intend to use this land for fruit and poultry. This is cut over land and not a great deal of it cleared, just about an acre, where the house stands. What kind of fruit would you recommend for this locality and when is the best time for planting?

I intend to make this my work when I get started, but will work at my business until such time as I am able to make the income from the fruit and poultry pay me.

I have always had 25 to 75 White Leghorns and had figured on keeping this breed. Do you think this is the best breed for one to start in or as so many so-called experts say, is there any difference in the breeds?

North Dakota.

J. C. Cromwell.

I would advise you to plant Wealthy, Patton Greening and Malinda apple trees.

The Hansen plum, also the DeSota plum, also Oregon Champion gooseberry, Red Cross and Fay currant, and Concord and Betha grapes.

The White Leghorn is a wonderful egg machine. I think you had better try out a few Rhode Island Reds.

Have a backyard chicken run of 40x125 feet, sown in alfalfa, one year old and planted recently with fruit bushes, such as gooseberries, raspberries, blackberries, currants and ornamental shrubs, in such fashion as to permit of planting of fruit trees.

What would you advise me to plant? Locality is high and dry. Is mulberry advisable? Will use twelve trees.

Illinois.

C. Herm. Erdorn.

Do not plant mulberry trees. Advise you to plant two Duchess, two Wealthy, two Black Ben, two Delicious and two Golden Delicious apple trees.

Early Laying Pullets.

I note where Mr. R. P. Thawley had a Buff Leghorn pullet to lay at three months and 24 days of age. We have him beat. Our first pullet to lay was hatched March 22, 1920 and began laying July 6, when three months and 15 days old. Just four days later another one began, and the next day following two more laid. All were hatched at the same time. We had several to lay before they were four months old.

Indiana.

FIRST PRIZE YOUNG PEN S-C WHITE LEGHORNS HEART of AMERICA SHOW KANSAS CITY MO. NOV. 1920.
WHITE HILL FARMS LITTLE BLUE MO.

Comment on Two Articles.

I am going to refer to two splendid articles in your American Poultry Journal of November issue. The first, by Ed. A. Brooks, won second prize in your contest. In it he states his efficient method of sanitizing his hen house after disease, but I wish to make a few suggestions.

After he has it thoroughly swept and roosts scraped clean, he should take a couple of cans of concentrated lye and dissolve in hot water and use this to scrub the floors and roosts.

He will find it much more efficient than soap and it is to some extent a germicide. I leave it on the floors over night. It eats all the filth off and if thoroughly hosed the following day, his house will be absolutely clean—then use a good spray. We use one part crude carbolic to nine parts crude oil. Another is a Raleigh Mixture with water—this also has carbolic in it.

As to his suggestion of whitewashing the interior for light reflection, I would advise him to put in a few windows instead.

We here are the large Petaluma chicken

community and at the present time, no one uses whitewash on the interior of a house. One reason why is, when you spray your houses after cleaning your hen houses, the spray will not adhere as well on whitewash as it does on rough lumber, and the other is that it eventually peels off in places and that makes a fine hiding place for all sorts of pests.

As to the second article, by Willard C. Thompson, which was on the eradication of round worms by the tobacco method:

I believe nearly all of us in this community

have used his method for years. But in the last two or three years the following new tobacco method has been used with so much better success that our Farm Bureau sent out circulars with only the new method advised: Use 2 percent of ground tobacco dust in the mash every day for six weeks, that is to fifty pounds of mash use one pound of the ground tobacco dust. You may either feed mash dry or moisten it, just as you are in the habit of feeding.

In the old method, the very hens that need the dose most are likely not to feed that day and not get the dose at all, where the healthy ones get an overdose. But in this method, the sick ones are bound to get it during the allotted treatment period.

Furthermore, these round worms are continually depositing thousands of eggs which I believe are hatched every seven days, and with this method you are continually getting the young ones as you will notice in the droppings even three or four weeks after beginning treatment.

With the old method of starving birds before giving the strenuous treatment of tobacco and salts, you will notice a decided drop in egg production for a few days, but with the new method we have found no after effects except that the birds feel better. I would advise this treatment once a year where you know they have worms.

Calif.

Mrs. Geo. James.

S. C. REDS AT THE RECENT GARDEN SHOW.

By H. L. MAPES.

This year's show brought out what was, without question, the best quality, as a whole, ever seen in the east. There may have been in other years individual birds of higher quality than the winners this year, but in every class except the hen class, this year's birds outranked those of any former year, considering each class as a whole.

COCKS.

The cock class contained three stars and it is my opinion that all three of them are superior to anything yet shown in the east. Both the first and second birds were centers of attraction for Red breeders throughout the week and, if the third bird had had the advantage of a top-tier coop, he would have attracted just about the same attention. The first bird is a Red in every way, always standing with his back horizontal and with a long, straight keel. Has a fine head, carries his tail right and, all in all, little criticism can be offered regarding his type and station. In color he has everything which should go with a good Red, breaking only very slightly at the base of his hackle. He scores over the second bird in wing markings and undercolor, but fails a little to the second in brightness of surface color.

The second cock is just about as much of a wonder, but stands a bit off horizontal and lacks a bit in keel. Has a fine head, with nice neat comb, marred somewhat by missing points. In surface he breaks quite a little between hackle and breast, but is wonderfully bright in color and generally very even. Has good wing and is quite sound under but not so rich as the first cock.

The third cock is of fine type and good even color and in any former year would have been acclaimed a real wonder. Both the fourth and fifth cocks were of the very highest class, but were a bit overshadowed by the wonders above them.

THE HENS.

Hens did not quite come up to the Standard set by the other classes, though the first hen is certainly among the very best ever seen. The class fails considerably in quality, on account of the presence of excess black in many of the hens shown. The first hen is good in type, though a bit leggy, has good head, a long straight back and in color is about as near perfect as they come. Has a fine wing and in undercolor can hardly be faulted. This same hen was first at Washington and when brought together with one of the greatest pullets of the year, for color special, she lost only showing a few feathers on her breast with a trace of shaft.

The second hen was a real good one, but not above what we would expect of hens shown at the Garden.

THE COCKEREL CLASS.

The cockerel class was a hummer, and it is the first cockerel class I have ever judged where there was not at least one or two really bad birds. Every cockerel in the class was a distinct credit to its breeder.

The first bird was of fine type and station, with neat head and nice tail carriage and in color is all that could be desired. There have been many great cockerels at the Garden but not more than one or two better than this fellow.

Illustrated folder free. Eggs \$7 to \$10 a setting of 15.

ALFRED F. GRAHAM Cameron, N. C.

The second is another fine bird, failing to the first only in type. He is a bit short in back and lacks keel, somewhat, but stands well and is what could be called a good shower.

The third cockerel is a grand one, but on the day of judging, he carried his tail at a rather sharp angle, and this marred his appearance. He carries fine surface color and is very good in undercolor. The fourth is a bird of good type and fine color, losing only to the other three in minor details. Fifth is a cockerel which will undoubtedly be a great deal better in another month, for his tail was not fully developed, and he had the general appearance of a youngster; in many ways resembles the first cockerel in type and color.

A GREAT CLASS OF PULLETS.

The pullets deserve every good thing already said about the cockerels. As a class it was a wonderful collection, and there were many very unusual pullets outside the ribbons. The first pullet fails a little in type, but I have never seen her superior in color, and in this respect she easily outstripped the balance of the class. Her head is a little fine and her legs were faded but hardly a single color defect could be scored against her.

The second was a fine upstanding big pullet but had evidently been laying and her comb marred her somewhat. Has good surface color, a good wing and is sound except for some light in undercolor at shoulders and wing bows. Many of the aisle judges had the third pullet picked to win, but in my judgment, she is a little too dark and she had quite a little smut showing in wing bows. She is good in type and even all over with a wonderful wing, but I believe her defects were enough to put her below the other two. Fourth pullet is a mighty good one, losing only because of a deficiency of black in wings, and a little in undercolor. In the general run of pullet classes the fifth would be hailed as a star.

THE PENS.

The old pens were a source of great satisfaction to me, for it is very hard to mate up pens of old birds so that they will match properly and at the same time keep the quality up to the highest standard. This year every pen was a first class one and the ribbons went as they did on the presence or absence of very minor details. Every pen was well matched and in these pens were several hens, which could not have been out of the ribbons in the open class.

Young pens were far above the Standard set in other years, for every pen was well worth going over carefully for all minor defects and not a pen could be eliminated from competition with one inspection. The first pen is, probably, the best pen yet put together, for while I do not think the four pullets of two years ago have ever been equaled, the cockerel in this year's pen was the best cockerel I have ever seen in a pen and he is good enough to pull the pen over any ever shown in the east, at least.

The second pen was another really fine one, with well matched pullets and a cockerel of open-class quality. Third pen had four great pullets, well matched, and thoroughly sound, but the cockerel was not up to their standard, and pulled them down under the second pen.

Fourth and fifth pens were well matched but the male birds were not up to the mark set by the first two pens and some faults could be found with the females. Outside the ribbons were some nicely mated pens and one in particular had to be passed outside, on account of the excessive black in four very fine looking pullets.

It is a very great satisfaction to see the general improvement in the Reds from year to year. One hears on all sides the remark that no other breed shows the steady improvement seen in the Reds. This year, at the Garden, hardly a specimen was shown having slit wings, and while there was a good deal of foreign black in the hens, there was practically none in the cocks, cockerels or pullets. There is still the serious defect, in the male birds, of lack of keel, and a balance off horizontal; but the birds this year are a distinct improvement over any former year and I look for very marked advances along this line during the next two or three years. When a breeder sets himself down to the task of improving any section of his flock, something has to happen, and it is this determination to constantly improve which has turned a breed that, in the beginning, was the laughing stock of fanciers, into the popular Rhode Island Red of today.

A basement is the best place to store the hatching eggs because the temperature is uniform and is not warm enough to cause germ growth nor cold enough to weaken the vitality of the egg. Hatching eggs should not be held more than ten days before setting for best results and it is very unsafe to set eggs that have been laid more than fifteen days.

You can raise more chicks

Unless you use H-O STEAM-COOKED CHICK FEED you are losing many chicks that could be saved.

Raw, musty, indigestible feed kills millions of chicks every season.

You can save your chicks by feeding them

H-O STEAM-COOKED CHICK FEED

It is a scientific combination of selected grains cut to pin-point fineness and steam-cooked by our exclusive process. Steam-cooking makes it digestible, and prevents the deterioration that takes place in raw grains.

It saves the lives of baby chicks and supplies them with the needed bone and muscle building elements; they mature more rapidly and attain a larger size.

999 QUESTIONS AND ANSWERS

124 pages. No matter what question arises, this book gives the answer in a few words. Questions for the fancier; about feeding, correct rearing of chicks, what and how to build, diseases, incubation, breeding turkeys, ducks, geese, etc. Paper, 50c; cloth, 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

IT PAYS TO HATCH EARLY.

Is it your intention to try to make a practical success of your poultry keeping during the coming season? If so, you must go about it the right way. Experience has taught one that the early hatched pullet is the paying proposition. Chickens hatched late have to bear the heat of the summer, when green food and insect life are conspicuous by their absence unless otherwise provided for, the result being weak and puny birds, and if you have had any experience at all in the poultry business, you will know what that means. Such birds are susceptible to sickness and disease and any change in weather conditions is likely to cause great trouble with them, whereas those birds hatched in the earlier months have a chance of developing before the hot weather sets in, and are therefore more capable of resisting sickness and disease.

Give your poultry a fair chance. There are quite enough unavoidable pitfalls in this business without circulating others that may be avoided.

Get in early and avoid the crush when eggs are bringing top prices next year. It is no use mincing matters, because what I am giving you now is solid fact. It is the early hatched well bred pullets that give us eggs in the period of greatest scarcity and consequent highest prices. To have these early-laying pullets we must get the chicks started early and as I have already said the early hatched ones in my experience have already proved this. If you get your chicks out early you have only to do your part henceforth to be assured of the most profitable prices for brooders, and good egg production, beginning in the Fall and continuing throughout the winter, the period of high prices. If on the other hand, you do not get the chicks out until late in the Spring or early Summer, nothing that you can do will bring the pullets into laying until the season of high prices is practically over. You cannot afford to do that.

There is no room to question the fact that late hatching is one of the greatest handicaps with which the poultry keeper has to contend in any

country. It is this that makes broilers so scarce at any price early in the season, and places them on the market later in numbers that bring prices down to low levels. Undoubtedly it is late hatching that makes fresh eggs unobtainable throughout the Fall and most of the Winter, and floods the market with them in the Spring, at prices that may be profitable but are too low to be really attractive.

Of course all breeds do not take the same length of time to come to maturity, therefore breeders must make due allowance. If you are keeping Leghorns or similar breeds very early hatching is not necessary or desirable, though even Leghorn breeders, in a majority of cases, habitually handicap themselves by hatching too late in the Spring.

On many farms, also in back yard flocks, the larger breeds are kept, such as Orpingtons, Rhode Island Reds, Wyandottes, etc., the pullets of which require six to eight months, as a rule, to reach laying maturity. Late hatching means that these will not come into laying until the approach of

BETHLEHEM, PA.

Spring. The same kind of pullets, if hatched earlier in the Spring, will commence to lay in the Fall and continue to do so throughout the following Winter, Spring and Summer months, if rightly handled, and would lay fully one-half more eggs in their pullet year than is possible where they do not begin until the Winter is nearly over. For confirmation of these facts you have only to turn to any official records of egg-laying competitions.

In conclusion let me draw your special attention to the following summary of the more important advantages gained by early hatching which you should always bear in mind if you wish to make your poultry-keeping a success.

1. A considerable egg yield is secured during the Summer and Fall,

when the yearling hens are not laying, due to the moult.

2. The eggs produced during the Fall months bring high returns as this is the season of high prices, due to scarcity of the product.

3. The pullets may be profitably used to produce hatching eggs the following Spring. A good number with strong germs and of good size is assured.

4. Cockerels which can later be used for breeding, attain a good size and make a strong development early in the season.

5. Surplus cockerels will sell for high prices during the months of November and December (Christmas season) at which they are in great demand.

6. The pullets reach maturity long

before the cold weather commences, the result being greater vigor and better resistance powers.

Now, these are just a few facts and I trust they will bear print.

Percy B. Prior.

Be Ready for the Hatch.

"Hatch early" should now be in full swing in all sections of the country. When you start the incubator, you should also clean out and disinfect the brooder. Do not wait until the chicks commence to hatch before getting the brooder ready. The day the hatch is on in the incubator, the brooder should be all ready for the chicks with the heat at a proper temperature.

When getting the incubator ready, make a thorough job of it. Throw out the old oil and wicks. Test the thermometer, and don't guess at anything. By all means follow instructions. If early hatching is to be successful, it will be necessary to look after the details as mentioned, and no doubt many more. In order to select big, well developed breeders next winter, we should hatch early chicks from vigorous breeders this spring.

Natches, Miss.
Wis. Inc. Co., Racine, Wis.
Sir:—Am glad to inform you of the results I obtained with your incubator. Set it with 180 eggs and hatched 176 chicks. I have four different incubators but prefer the Wisconsin as it is perfect in every respect and very easy to handle.
Yours,
T. L. STEVENS.

Hutchinson, Minn.
Wis. Inc. Co., Racine, Wis.
Gentlemen:—Last March we ordered 12 incubators from you and were so well pleased with them we ordered 12 more; also one for a friend. My hired man ran all 24 incubators and both he and I were well pleased with the results and expect to order more this spring. Yours truly,
J. W. NIGHTINGALE.

Incubators and Brooders

Then you will know which machines are built best, which will last longest and which will give you the most value for your money. Year after year these unbeatable Wisconsins have proved their superiority over all other machines, regardless of price. Below are a few of the record-breaking hatches taken off by owners of this famous Wisconsin outfit.

Wisconsin Incubators Have Double Walls

It pays to investigate before you buy. For example: Wisconsin Incubators have double walls—the outer wall is of California Redwood and the inner wall is of insulating board with dead air space between the walls. Hot water heat—double glass doors—**COPPER TANKS**—self-regulating. Roomy nursery under egg tray. Incubator is finished in its natural color, showing the high grade California Redwood lumber used—not painted to cover up inferior material. Both machines shipped complete with thermometers, lamps, egg tester and book of directions; **all set up ready for use** when you get them. Freight paid east of the Rockies.

You Take No Risk!

I have been advertising in this paper for years. The publishers know me and know I do just as I agree. One good hatch will pay for a Wisconsin outfit and more. Send in your order direct from this advertisement or write today for our free catalog. Address

JERSEY BLACK GIANTS

Again the sensation of Madison Square Garden, 1921; our Giants make a grand win at the world's Greatest Poultry Show—1st and 3rd cock, 1st, 2nd and 3rd Hen, 1st, 3rd and 4th Cockerel, 2nd, 4th and 5th Pullet, Special Certificate and Blue Ribbon for Best Display. The **EIGHTEEN-POUND GIANT CAPON** attracted the attention of thousands. Some of the greatest poultrymen in America are taking up the breeding of Jersey Black Giants. (THIS SPEAKS FOR ITSELF.)

On Dark Cornish, against the pick of Europe especially imported for this exhibit, we won—4th and 5th Hen, 2nd and 3rd Pullet, 2nd Old Pen and 3rd Young Pen.

EGGS FOR HATCHING ONLY

BLACK GIANTS—From Pen A and B, Madison Square Garden and Boston winners, \$20.00 per 15 eggs; from Pens C and D, Trenton and New York State (Syracuse) winners, \$10.00 per 15 eggs; from Utility or Farm Flock, \$6.00 per 15 eggs. **DARK CORNISH**—\$20.00 and \$10.00 per 15 eggs only.

Order direct from this adv. or disappointment may be your lot. All orders booked in rotation as received. 117 Prizes, 2 Specials, 2 Best Displays and American Poultry Association Award of Merit all in less than 5 months. Complete catalogue with cuts of winners etc., ready March 30th.

First Pen Cock, Chicago Coliseum, 1920

HILLVIEW SINGLE COMB WHITE LEGHORNS

Have made amazing records in Egg Laying contests of National Fame—and record winnings in America's largest Show Rooms. The impressive winnings of Hillview Leghorns of almost every ribbon at the Chicago Coliseum show of 1918–1919–1920, and the winning of first prize Pen in Missouri and American Egg Laying contests, is still an unbroken record.

The Winnings of Our Customers

is the main factor of Hillview success. We have no reserve matings or birds. The winnings of our customers at St. Louis, Kansas City, Omaha, Chicago National, Hagerstown, Alabama, Louisiana, Illinois, Ohio, Oklahoma, and many other State Fairs, Canada, and all over the continent, is convincing proof that we share equal honor by furnishing them the best of our many years of selective line breeding.

Hillview Leghorns Produce Champions By the Hundreds

They don't crop out by chance at Hillview—there is an established blood line back of them that they have never failed to produce results.

Hatching Eggs and Baby Chicks

from Hillview will assure you the most pleasing results, because they are from the best matings in the world. Book your order now to insure prompt delivery. Satisfaction guaranteed. Illustrated mating list free. Write today.

BLUE ANDALUSIANS AT BAT.

By VORIS MORRISON.

Balls three. Strike two. The bases are full and the score tied. Blue Andalusians are at bat. A home run is knocked and the victory won.

This is the way Andalusians are knocking home runs and are getting into the homes of many of the real poultry fanciers. Why? Because the fancier has watched the Andalusian for years and has decided that the Andalusian is making more progress than nearly any other chicken. He also has found out that the Andalusian is the most handsome chicken of the feathered tribe. He has found that their laying ability is far beyond the average.

If they had received the same breeding as other fowls for egg-production they would probably be among the leaders now. By careful breeding the results will be astonishing. The Andalusian may never become as popular as the Leghorn but it will give the Leghorn a close race for leadership. It may take several years for this to come, and it may be only a few years.

Nearly all breeders and fanciers will say that the progress is very rapid. Many of them have written me that they have been unable to supply their demand. They say that they have raised many more each year but their demand grew larger and faster than their supply. This has also been true in my own case.

Last season I did very little advertising. What little I did, I had to stop before the time was up because my supply was far below the demand. Orders just poured in and several had to be sent back. I have increased my flock 200 percent and indications show that I will not supply my demand this year. So with a few more years like the last three or four years it is evident that the Andalusians will have a place among the leaders.

A Few Words About the Club.

The Blue Andalusian Club of America is a live organization and was organized in 1913. It has been rapidly growing ever since. It now has over 200 live wire members. Nearly fifty of these live in Canada. The United States had better watch its step or the Andalusian might become the national fowl in Canada in place of the United States, even if it is red, white and blue. We are going to try to double our membership this year if possible.

Nearly all the shows in the country have had a nice entry of Andalusians this season. There were forty-eight birds at the Illinois State Fair. Pretty good for a fall show. St. Louis drew out fifty-six birds and Chicago also had a nice entry. The Boston show had all the single classes full and running over. I have shown at eight shows this year and have found good competition at all of them with one or two exceptions.

The Club has had a hand in drawing out so many fine entries. Indications are that the coming season is going to be one of the best ever known in the history of the Andalusian. So if all breeders will get busy and keep up the good work we will show the public that Babe Ruth hasn't anything on the Andalusian when it comes to knocking home runs.

All

FUL-O-PEP

Feed Patrons

"The Man Who Has the Key to Poultry Success"

Think of it! A complete poultry course by one of the country's best poultry experts absolutely free. It won't cost you a cent. Next to giving to poultry raisers the famous Ful-O-Pep Feeds, we consider this free poultry course one of the biggest things we have yet done to promote the interests of the poultry raiser. This course is for the sole benefit of Ful-O-Pep customers. It consists of over 50 lessons dealing with a complete study of the great subject of successful poultry raising. Here are some of the lessons and bulletins:

The first lesson—The Commercial Egg Farm—Breeds and Varieties—General Purpose Type—Egg Type—Meat Type—Principles of Breeding—Natural Incubation—Natural Brooding—Brooder Houses and Equipment—Poultry Houses and Equipment—Care of Breeding Stock—Feeding and Management for Egg Production—Selecting the Laying Hen—Increasing Egg Production by Illumination—Marketing the Commercial Egg—The Day Old Chick Industry—Feeds and Methods of Feeding—Feeding Equipment—Growing and Marketing Broilers and Roasters—Feeding Young Chicks for Quick Maturity—Capon and Caponizing—Poultry Diseases, Treatment, Cure and Home-made Remedies—Sanitation—Fattening, Killing, Dressing and Packing—Conditioning and Exhibiting Fowls—Preserving Eggs for Home Use—Poultry Secrets Disclosed.

The above are only a few of the many subjects covered in this complete course—a course that treats on and fully covers every poultry problem from A to Z.

To secure this Poultry Course Free, simply go to your dealer, hand him the coupon below properly filled out, giving him the order for Ful-O-Pep Dry Mash, Growing Mash or Chick Feed, just your regular order, same quantity as you are accustomed to buy. Your dealer will sign the coupon. You mail it to us and we will send you your first lesson with text and list of questions for you to answer and so on, until you have received the entire course of more than 50 lessons. This service is free only to those who use Ful-O-Pep Feeds.

Another **FUL-O**

Grand View Poultry Farm

Read the letter on next page that came to us unsolicited. This is just an every day occurrence with those who adopt the Ful-O-Pep Way.

The ever increasing popularity of Ful-O-Pep Feeds is due solely to the results that poultry raisers obtain by their use. It's results that count—it's results that make poultry raising profitable. If you are not feeding Ful-O-Pep Feeds to your poultry you are overlooking the biggest factor in poultry success. For larger egg production—for faster growth—for strong, sturdy young stock, feed Ful-O-Pep Feeds the Ful-O-Pep Way and you can't fail.

The **FUL-O-PEP** Way *Makes Poultry Pay*

When you buy day old chicks, buy them from a hatchery that raises its breeders on Ful-O-Pep Growing Mash and secures its hatching eggs from Ful-O-Pep Dry Mash hens. They are different from all other chicks, sure to live and pay. Feed them the same way as their mothers and daddies were raised and your poultry troubles will be a thing of the past. Hatcheries using Ful-O-Pep Feeds can guarantee chicks that will live and grow into big profitable layers. The kind that win honors in National Egg Laying Contests.

Why take chances—why try this, that or the other method when you can be absolutely assured success if you take Ful-O-Pep for your motto? Let your day old chicks—your growing birds—your laying stock—your breeders—your market birds all be Ful-O-Pep raised. It pays big.

Jan. 15th, 1921

Gentlemen:

I have felt that it was my duty to let you know that since we start feeding your Ful-O-Pep poultry feeds that we have been wonderfully successful in the rearing of our chicks and in getting eggs.

We have tried many different brands of poultry feeds to find which was best, but we have found none that is anywhere near to Ful-O-Pep. We have fed it exclusively for the last two years and cannot do without it.

We have one interesting fact which I wish to state in regard to your feed. We started off 3000 of our Egg Basket Strain chicks last June, 1920, and raised over 90% to maturity and we took photos of a few of the birds when at the age of four and a half months, and we have them enclosed to see for yourself their size, and weigh over four and a half pounds each at that age. Five of these pullets we entered in an International Egg Laying Contest, and we had the honor of being in the winning class for November month and also December month. A June 2nd hatch bird, fed on Ful-O-Pep made a winter egg record being fed on Ful-O-Pep Feeds exclusively. We want no other feeds on our plant.

I want to mention this fact, that your feeds are a balanced ration and unexcelled in feeding value.

Wishing you success with your poultry feeds,

Yours very truly,

GRAND VIEW POULTRY FARM.

"The Feeder That Grows With The Chick"

How To Use This Adjustable FUL-O-PEP Feeder

For your young chicks start it just as received, one section deep. Fill with Ful-O-Pep Growing Mash. Keep it before the chicks at all times, the more mash consumed the faster and greater the growth.

Change Size of Feeder to Meet Requirements of Growing Birds

As the chicks grow and require a larger feeder, one that holds more feed, simply screw top part of feeder to the right. This enlarges and deepens the feeder, increasing its capacity. Enlarge it just enough to meet the chicks' requirement for the present. Each time the sections are turned means a new size feeder. Continue this method of adjustment as the chicks grow to maturity.

An indispensable piece of Poultry Equipment. The pictures tell the story. Note the principle of adjustment. Can be used for feeding all ages of poultry—from

the day old chick to matured fowls, Turkeys and Ducks and Geese.

Adjust it to any size holding from one pint to four quarts of feed.

Price only \$1.25

Dissolve Partnership.

The Utley-Sturtevant Poultry Farm at Downers Grove, Illinois, beg to advise that this partnership was dissolved, Feb. 14, 1921.

The business will be carried on in the future by Mr. Paul H. Utley, Downers Grove, Illinois, specializing in Rhode Island Reds. Mr. Sturtevant has accepted a position with the D. G. Poultry Co., Inc.

All indications point toward a big general business in eggs for hatching during the coming spring. There will be the usual regular trade, and in addition the trade of many beginners and those who will take up poultry again after being out of business since war conditions have existed. The many shows are creating enthusiasts by the thousands and the breeders who made good use of advertising space are certain to do a nice business.—National Poultry Journal.

BERRY'S FARM, Box 150 Clarinda, Ia.

Exhibit Quaker Oats Co., Indianapolis Poultry Show, Feb. 1 to 6, 1921.

The Famous Indianapolis Show.

By Theo. Hewes.

From what information I can gain, Indianapolis holds the proud distinction of having held more consecutive shows than any one city in America. The first exhibition was held here in 1873 and there has been an exhibition every winter since that time, although not all have been held under the same name, as different associations have controlled at different time, but this exhibition for forty-eight years has been looked upon by the breeders of the United States as one of the real fanciers' shows of America, where a winning in any of the important varieties carried with it great value from an advertising standpoint.

In tracing back the history of this exhibition, not alone for my own information, but for the information of the general public, I find there are but two members of the original association living today. They are C. H. Johnson and W. F. Christian of Indianapolis. I was fortunate enough to secure a good photograph of these two old fanciers and am enclosing same with this article, and am giving here the list of officers of the first poultry show held in this city:

President—A. C. Shortridge, Indianapolis.
Secretary—W. H. Fry, Indianapolis.
Treasurer—W. F. Christian, Indianapolis.

Executive Committee.

I. N. Barker, Thorntown.
C. H. Johnson, Indianapolis.
John Bennett, Sunman.
Many readers of this paper will remember I. N. Barker, as he was one of the most

prominent judges some thirty years ago, and the father of M. S. Barker, the famous Black Langshan breeder of the present time; and they may also remember Mr. Bennett as being one of the old time breeders of White Faced Black Spanish. C. H. Johnson was one of the oldest breeders of Buff Cochins, importing his first birds from England in 1874, and for twenty-five years following this importation he was known throughout the middle and eastern states as one of the best breeders of this variety, and has judged this class in many of the leading exhibitions.

One of the Old-Timers.

Among the early fanciers, and one known to practically every breeder of Standard poultry of America, was the late Sid Conger of Shelbyville, Indiana. He afterwards became associated with this organization as one of its officers and even prior to the first Indianapolis show, had exhibited poultry at the old State Fair in Indianapolis, when the grounds were located at about 16th and College Avenue, which is now in the thickly settled residence district of the city.

Mr. Johnson, in describing Sid Conger's entry in the poultry arena, says that Sid drove in with a one-horse rig from Shelbyville, with a lot of chicken coops of different varieties tied onto the wagon with ropes. He had on an old pair of cotton pants, about four inches too short, a 75-cent hickory jumper, and after driving the twenty-four miles in the dust, he was the same color as the horse, the wagon and the chicken coops. Everybody rushed out of the poultry building to see what had happened and were introduced at that time to the man who afterwards be-

Partial View of Residence, Office and Henneries 1 and 2, on Kerlin's Grand-View Poultry Farm, Center Hall, Pa.

came not only a famous poultry fancier, but was recognized as one of Indiana's greatest politicians. Undoubtedly Sid Conger did more to shape the destiny of many of the Republican leaders that became famous in later years, than any one man in the state. However, the only important position that Mr. Conger ever held, politically, was state oil inspector.

Influence of the Show.

There are more people making an independent living out of the breeding of Standard poultry in this state than any other state in the Union. There are more big successful poultry breeding establishments here than in any one state and many of these farms have been in operation for more than a quarter of a century. These facts are known to the fanciers and are the prime reasons why a winning at the Indianapolis Show carries with it the prestige that it does.

The Hoosier fancier is a practical fellow. He goes in for breeds that possess market value as well as fancy points, and in the popular varieties he has stocked the farms,

C. H. Johnson and W. F. Christian, Exhibitors at the first Indianapolis Poultry Show, 1873.

and today it is safe to say one could find Plymouth Rocks, Wyandottes, Leghorns, Reds, Langshans and Brahmas of the several varieties in greater number and possessing greater Standard value on the farms of Indiana than on the farms in any other one state in the Union.

Indianapolis is handicapped by the size of its exhibition hall. This year we were compelled to double-deck a part of the exhibition in Tomlinson Hall, but the location of this building is so favorable that we find it hard to consider a change; but may eventually take the show to the Coliseum building at the fair grounds, which is a part of the city now.

The judges at this year's exhibition gave good satisfaction and will be retained for the forty-ninth annual exhibition that will be held Feb. 8 to 12, 1922.

Bumble Foot.

I lost four fine hens with bumble foot, caused through high roosts. The fifth hen I cured completely by putting on hot flaxseed (ground) poultices night and morning for a few days, first picking out the hard center which forms a callous. Put foot in an old sock, first cutting off at heel to form a bag, then tie up high enough. Put on enough hot flaxseed to cover foot even when she walks. I furthermore put her in a separate pen by herself.

The pain must be great that it produces a fever; and from that the bird got the roup. So at the same time when treating for bumble foot it might be well to put enough permanganate of potash in the drinking water to turn it to a pink color, which will serve as a mild antiseptic to ward off disease. My hens weigh 7 to 9 lbs., and my roosts are now two feet high.

Good Feeds Make Healthy Chicks

It is impossible for you to have good sound healthy chicks if the feeds that you are giving them are not guaranteed strictly fresh. To make sure that you are getting guaranteed feeds that are sound and free of musty, hospital treated grains and ingredients you should buy direct from us—our business is furnishing

Basic Feeds

to poultry feeders. And every pound is genuine food, ground in our own mills and guaranteed by us to be pure and wholesome—and sound.

Pinhead or Steel Cut and Rolled Oats

Let us send one or both of these wholesome foods to feed to your growing chicks. There is no more wholesome food to be found anywhere than these two.

Send Your Formula Write and tell us what you are feeding and we will quote you prices that are governed by the quotations in the grain market, and when the prices go down you get the benefit. Could anything be fairer? Let us quote you on hulled or pinhead oats. We want you to know more about basic feeds as ground and sold by us. Let us send you our current price list; you can see what ground poultry meal is worth at mill prices.

BASIC FEEDS COMPANY

COLUMBIAN PLYMOUTH ROCKS.

By HENRY L. WILBUR.

Those who are really interested and seek information about poultry, I'm inclined to think, are not so particular about flowery phrases and grammatical construction of sentences, as they are in the practical and common-sense truths; therefore, without posing as an efficient or polished writer, I shall endeavor to express a few

facts concerning Columbian Plymouth Rocks.

While authorities differ as to whether domestic fowls descended from one or more sources, it is pretty generally known that there are two distinct types: the large, heavy bodied, abundantly feathered fowls of China, and the smaller, more active breeds of the Mediterranean countries of Europe.

The stock of China and Eastern Asia remained under cover for centuries. These large fowls of Asia were

not distributed until the ports of China were thrown open and Chinese stock was carried by trading ships to other parts of the world. Not until about 1846 were the original pea comb Brahma fowls brought to the port of New York.

Inasmuch as the Light Brahma is wholly Asiatic, the Barred Rock, largely of Asiatic origin, and the White Rock a direct sport of the Barred Rock, it seems logical to trace Columbian Plymouth Rocks to this

Morris' White Orpington Champion Pen. Owned by Morris Poultry Farm, Box A, Lebanon, Ohio.

early origin, as the best Columbian Rocks originated from a Light Brahma and White Rock cross.

From the most reliable information I am able to procure, Columbian Plymouth Rocks originated from a number of crosses. A cross-bred male of Plymouth Rock type and Light Brahma markings was mated to both Barred and White Plymouth Rock females; and the offspring from these matings were mated, remated, selected and bred in line. Thus was one of the first strains of Columbian Plymouth Rocks produced. Another strain, without a doubt the best and most practical, was produced from a direct cross of Light Brahma males with White Plymouth Rock females.

Another strain was originated by mating Light Brahma males to White Plymouth Rock females, then crossing the offspring with males from the two strains before mentioned, and with single comb offspring of Columbian Wyandotte fowls.

Following this, several strains of Columbian Plymouth Rock fowls were produced, and when sufficient interest had been aroused to attract general attention to this breed, the American Columbian Plymouth Rock Club was organized, a Standard was adopted, and application made to the American Poultry Association for recognition. Columbian Rocks were admitted to the Standard at a meeting held in St. Louis, Mo., in August, 1910.

Development of Columbian Rocks has progressed by selection of the best fowls of their kind, and mating, in many instances, without regard to their origin. While improvement was made by such matings, great difficulty in the production of color and markings was experienced by the early breeders. This would be the natural result of too quickly intermingling so many different strains and varieties. Wonderful strides have been made in the last ten years. Many of the early perplexing breeding difficulties have been mastered, and today the Columbian Rock compares favorably with other varieties of Plymouth Rocks in weight, shape and breed characteristics, and closely approaches the color and markings of the Light Brahma.

In type and size the Columbian Plymouth Rock should be as nearly as possible the equal of the other varieties of Plymouth Rocks, and we find the birds running uniform in Standard Plymouth Rock type and size. In color and markings, as stated above, they should correspond with the Light Brahma. The shanks, feet and toes should be yellow or reddish-yellow, free from stubs. Stubs, or indication of same, on shanks, feet or toes are a disqualification. Face, comb, eyes, wattles and ear-lobes should be red. White in ear lobe is another disqualification. General Plymouth Rock type, weight and breed characteristics combined with true Light Brahma color and markings, describes "in a nutshell," the Columbian Plymouth Rock.

If you have no green feed, Epsom salts given every ten days—about one pound to one hundred hens, in the drinking water will give surprising results. Salts has a like effect unto green feed, as a laxative and cleanser.

ALDEN'S Great Majestic White Orpingtons

HAVE 14 years' constructive line breeding back of them. They carry on the great American Line Bred (Stay-White Male) Strain originated by the Woolery Farm, a strain that for years has won the highest honors at Madison Square Garden, Chicago Coliseum, Hagerstown, Cincinnati, and Indianapolis shows.

"VIKING" RHODE ISLAND WHITES

Are the GREATEST OF ALL LAYING CHICKENS

At our biggest national laying contests the Rhode Island Whites are making more wonderful official laying records than have ever been made by any other variety of poultry. At the last great American Laying Contest the R. I. Whites averaged 243 eggs per hen for the year, the White Leghorns averaged 190 eggs, and the Anconas 117 eggs. The R. I. Whites averaged more than twice as many eggs per female as the Anconas. And they are also splendid market fowl, easily confined, easily raised, and beautiful.

A Boom Is Coming for This Grand Breed

Every thoughtful breeder of poultry should investigate now and get ready for the boom. "Once a breeder of 'Viking' R. I. Whites, always a breeder." Write today for convincing proofs and further information.

O. W. Binder, Box A, Fort Wayne, Indiana, U. S. A.

PARTRIDGE WYANDOTTES.

By T. W. SCHOEN.

"That's the kind of chickens I am going to breed. What are they?"

I heard that remark made by a young man to his wife as I watched the endless stream of people walking through the poultry building at the Michigan State Fair on Labor Day two years ago. Later I saw to it that this young fellow, who had made up his mind about the kind of chickens he wanted, before he even knew their name, got a start of the right kind—for the remark was made about Partridge Wyandottes. It was his first deal in purebred poultry and the transaction consisted of twelve chicks.

Six months after he put his chicks in the little brooder, he came out to see me with a coop, containing two cockerels. He wanted to know which one to keep for breeding and which one to kill. As both were too good to kill, I gave him two pullets for one of the cockerels, and he bred the other cockerel and seven pullets.

His birds were well grown, as they had had the range of two large vacant lots next to his house. By mating time last spring, the pullets had layed for over five months. Their eggs hatched and the chicks were strong and vigorous.

In the early fall, this beginner with

purebred Partridge Wyandottes had his flock culled, and as I watched the forty pullets walking in the green grass among young peach trees, I could not help thinking of the improvement the Partridge Wyandottes have made the last eight or ten years. And I trust you will not think that I am partial when I agree with those who call the Partridge "The Wyandotte of Wyandottes."

A well bred flock of Partridge Wyandotte is, indeed, a sight of beauty and well worth owning. It puts pride in the soul of the beginner and old fancier alike to see strangers stop at the fence and admire the birds. Few go by without stopping.

From the beginning of my Partridge Wyandotte breeding, it has been a question of making the useful still more beautiful. I found that the variety in winter time outlayed any variety I had ever kept. I also found that the cockerels were ready for the table at any age over nine weeks, and that their yellow, plump bodies were very eagerly sought by the housewives. Their juicy, well flavored meat brought me orders weeks ahead of killing time and anything within reason was paid for these broilers.

The Ability to Reproduce.

But in those days the variety did not breed uniform either in respect to size or color. That is, one could get a fair

Cosh's Barred Rocks

MAKE A SENSATIONAL WIN AT PHILADELPHIA, 1921. Winning in one of the largest and grandest classes of the entire season: Cocks, 1-2-3-4-5; hens, 1-2-3-5; cockerels, 1-2-3-4 (40 in. class); pullets, 1-2-3-4; pens, 1-2; carrying all shape and color specials, including American Poultry Ass'n gold medal for champion cockerel in American Class. All sweepstake prizes in snow, competed for, viz.: President's cup for best display in show; vice-president's cup, most points all varieties; Record cup, best display American Class.

This tremendous win is on a parallel with the victory achieved by our birds at Trenton last season; conclusive proof that our blood lines are right, and that Cosh's strain is the ideal for foundation or improvement of your present flock.

Male birds \$10, \$15, \$25, \$35 and \$50; females \$5, \$7.50, \$10, \$15, \$25 and \$35; trios \$35, \$50, \$75 and \$100. Pens \$50, \$75, \$100, \$125 and \$150.

Eggs from matings containing our champions \$15 per 15, \$28 per 30, \$40 per 50, \$80 per 100.

CHICKS

That commence to lay at four and one-half months old. Not just two of them, but scores of them. We guarantee 90 percent fertility, and to insure this or a little more we put in one or two extra eggs with every 15; the same applies to 100.

EGGS

BELLA VISTA S. C. WHITE LEGHORNS

of Tom Barron strain have made high records and won scores of blue ribbons for having laid 25 eggs or more per month at the official egg laying contests in the past few years, at Mountain Grove, Mo., Leavenworth, Kan., and Lincoln, Neb., with records of 200 to 255 eggs during the year.

We have 600 like these in our special breeding pens this season. We have been at it ten years. Prominent poultrymen say they are the best large flock of S. C. White Leghorns they have ever seen.

Eggs for hatching, \$3.00 per 15; \$12.00 per 100. Day-old chicks, 30c each in lots of 25 or over. Hens for breeders, two years old, \$4.00 each. March, 1920, hatched pullets, \$5.00 each, as good as you ever laid eyes on. Eggs from our pen of 30 trapnested hens, which were in the egg laying contests the past year, 50 cents each. After May 1, 25 cents each. If you want to raise this kind better order now, as we could not supply half the eggs and stock we got orders for last season. If interested, write for catalog.

BELLA VISTA POULTRY FARM, Box A, KIMMSWICK, MO.

The Magic Brooder

Self-regulating; efficient and high-grade throughout; built with top and bottom draft; gas-proof chamber (the only brooder with this improvement), rocker grate and improved regulator. Will brood strong, vigorous chicks. Reader, the success of raising poultry depends on the brooder. It must hold the fire and never go out. You only have to kill a chick once to be dead. Even one good chill will ruin them for life.

Buy the Magic—the most dependable brooder in the world; it **insures success**. The writer, C. V. Hill, gathered in December over 1,000 eggs per day from 2,300 layers raised with the Magic brooders, which net a clear profit of forty to fifty dollars per day. Come to Trenton and visit my Poultry Plant and see for yourself.

OUR GUARANTEE—Will refund money in 30 days if brooder does not do all we claim. Write for free catalogue, describing the Magic Brooder, together with plans of colony and laying houses. Live agents wanted in territory not taken. Address,

Farrow-Hirsh Co., Peoria, Illinois

number of well shaped, good colored male birds, but the culls among the pullets were too many. Nobody can afford to butcher pullets in any large percentage, for they are too valuable as winter layers. At the same time, no breeder with pride wants a flock of one variety that shows several different shades of color. The secret of the present-day growing popularity of the Partridge Wyandotte is that they are so beautiful and uniform that the beginner simply has to give them the good care chickens should have, and the birds do extra well for him. He gets in love with them at first sight.

As long back as the time I speak of here I had the vision Mrs. Mahood so well wrote about in last month's A. P. J. I had penned off three pullets, and one cock of the shape and color that could not help but make a dreamer of a man with the hardest nature. As I saw these birds, the male with his striking combination of piercing, cherry red, black striped hackle and saddle feathers against his greenish black breast and tail, standing there on his yellow, well set-apart legs, and next to him the pullets with their well-penciled coat of reddish brown, I dreamed my dream and wondered what popularity the variety would take the day that FLOCKS of this kind could be produced.

Large and small breeders of the variety all over America and Canada have worked as one man for the same end, and it is just as if Mrs. Mahood wrote her lines to Partridge Wyandotte fanciers, when she said: "Great honor to the man who has the gift for seeing visions and the ability to make them live; who has the gift for dreaming dreams and the ability to bring them true."

The dream that came true is just this: The beginner, for whose benefit this article is written, can mate up his one pen, be it on the farm, estate or backlot, and the offspring of this one pen will all be Partridge Wyandottes and as true to type and color as the parent birds which he used as breeders. He can get all the benefit of the labor and struggles of the old breeders, for at this time, shape and color are stamped in the variety, and the novice will get as few culls from Partridge Wyandottes as he will from any breed or variety.

Watch the Breeding Tendencies.

Several old fanciers are taking up the variety for the first time in their lives. When one thinks seriously of the matter, is it not wonderful how many qualities can be combined in one variety of poultry? I have talked of the wonderful winter laying ability of Partridge Wyandottes, also of the market side of the broilers and roasters and of their uniform breeding tendencies. To the old fancier, thinking of trying the variety, I like to say that nothing is more interesting than to aim for the highest in the way of show birds and to watch the results from well planned matings.

There are laws and rules in the mating of all Standard fowls, but the most important of them all is never pointed out strong enough, and that is: From the breeder furnishing the foundation stock, find out the tendencies of his strain. He cannot tell you all, neither can he tell you just how your birds will breed, but in case he is interested in his customers and wants to see them suc-

ceed, he can outline your first mating and warn against any haphazard steps you might take. He can tell you, for instance, if his strain is apt to run too light in color or too dark; and if you know these important points you can always guard against getting an off-colored flock.

After the first mating is done and the offspring grown, give the youngsters deep study, and remember that it is only in one mating out of one hundred that one is justified in mating pullets back

to their sire or in mating a cockerel to his dam.

It is really a crime nowadays to hear the horde of fanciers with just a few years of show experience say, "I am going to mate that cockerel back to his dam," or, "I shall mate some of that cock's pullets back to him." In nine cases out of ten they do not stop to ask themselves what they want from such mating, and none of them seem to think of the fact that a bird's bad points are just as easily intensified in the off-

spring by inbreeding as are his merits.

I have seen small but extra good flocks ruined by this mating-back stunt. Still, I have obtained the success of my own strain by just such matings. We must inbreed to fix the blood lines so strongly as to make them highly valuable. But if you are careful, you wait before undertaking such matings until you are fully familiar with the tendencies in your line. You cannot become a systematic breeder until you know the breeding tendencies of your birds.

The small holes in the top pan prevent the chicks from getting into the feed or water—prevent them from crowding too close around the feeder and prevent dirt and droppings from polluting the contents. There is absolutely nothing in the construction of these pans to become loose or broken—they overcome every objection to the ordinary Mason Jar pan and are the most desirable of all feeding and watering devices. Order them today. Sold and guaranteed by AMERICAN POULTRY JOURNAL, 125 PETERSON BUILDING, CHICAGO, ILLINOIS

BREEDING S. C. W. LEGHORNS.

By H. C. KNAPP.

Have you been considering buying a new male for breeding this season? If so, do not delay getting one any longer, as it is high time you had your breeding pens mated.

Get a good male, even if you have to pay extra for him. Remember that every one of the chicks sired by him will be half his blood, and the better male you get the better your chicks will be. By breeding him to his daughters and grand-daughters the following years you will get chicks three-fourths and seven-eighths his blood. This male is good for breeding for several years, and if you are any good at mating your stock you ought to be able to breed birds as good or even better than the original male.

Much has been said about following a line breeding chart, but few breeders really ever practice it, as it requires much of work and many separate pens. The best plan is to mate your stock from year to year as conditions seem advisable, taking care not to inbreed too closely.

To line-breed successfully requires breeding only from the most vigorous stock. A weak male bred to weak females will give you still weaker stock. In-breeding intensifies characters, whether they are good or bad, therefore never breed related fowls having the same fault, as this defect will be intensified in the stock bred from them, while if you breed for good points and vigor the offspring is sure to improve.

Try to do all of your breeding from adult hens only, as they lay much larger eggs and their offspring is superior in every way to those bred from pullets. The worst way to run down a good strain is to breed from pullets year after year until the females lay undersized eggs, and few of them at that.

Many beginners get a late start in hatching; the chicks come out late, and being late hatched they make poor breeders, often being undersized.

These late hatched pullets are often

A purebred Tom Barron cockerel. Owned by Coleman Miles Egg Farm, Box A., Mt. Carroll, Ill.

mated and the undersized eggs they lay are set. Whether the chicks from these pullets are hatched early or late they invariably prove a disappointment, being slow to mature, lacking vigor. They frequently prove to be poor layers of small sized eggs. The beginner will then condemn the breeder he bought from and say that his stock is no good and think that he was buncoed.

If the beginner had waited until the birds were in their second year before breeding, he would have nice large eggs from fully matured hens to set and the chicks that he got would have the kick in them and the vigor to mature early. He would then be a booster for the man who sold him the eggs.

Though hens in their second year are the best breeders without question, early hatched pullets that have not been forced to lay during the winter often prove satisfactory. I would prefer to mate three pullets to a cock, so as to have maturity on one side.

When buying hatching eggs insist on good sized eggs layed by hens. Be aware of any settings sent you that are not up to size. These have invariably been layed by pullets, and you can be sure that the birds you get out of them will not give you anything to brag about as to early maturity, size or as layers.

Here in Northern Ontario, I prefer to get out all my chicks during the month of April. Earlier hatching here is out of question on account of the care the early chicks require. Also Leghorn pullets hatched too early are liable to molt in the fall, same as hens, and be little better than hens for winter laying. My April pullets last year commenced laying in September and were laying several months before the winter shows came,

so I did my exhibiting at a large fall show, and was lucky to get 3 firsts and 4 seconds on 7 entries, including 3 "best in show" specials.

Our winter show is not held until late January. Would like it to be held earlier as pullets that have been laying a while before show time are past their prime and I do not get out any later chicks, especially for the winter show. Have talked with several fanciers about the show dates. Some, like me, would prefer them earlier, but most are satisfied with them as they are. The majority of fanciers here hatch late and so long as they do they will prefer the late shows, and nothing can be done about it. I think it is a mistake to hold shows too late, as it means the late hatched birds will be the best while early shows encourage early hatching.

In mating up your Leghorns, 15 females to 1 male is about right. Some say you should have less than this during the cold months, but I find that in the early cold months the females probably are not laying so well as they do later, and there are fewer eggs to fertilize. In fact some fanciers state they can add a few more females to the breeding pen in the cold weather when the birds are not laying well, which shows some people have different ideas.

However, 15 females to 1 male should be all right if the male is dependable. I had a 5-year-old, 6-pound Leghorn cock mated to 16 hens last March, when snow was piled deep outside, yet eggs from this pen mated to such a heavy male ran 90 percent fertile throughout March.

The hens in the breeding pen were fed no wet mash. They have access to a well balanced dry mash at all times and are fed scratch feed in deep litter twice a day. They get lots of sprouted oats and green stuff.

BEAUTIFUL GOLDEN CAMPINE.

By C. G. BATTLES.

About twelve years ago, while visiting one of the largest of our winter poultry shows, I was attracted by a pen of very beautiful fowls. Upon inquiry I learned that they were Golden Campines. Their beauty impressed me so much that I determined to some day own some of them. About two years later I sent to this same breeder, whose birds I had seen at the show, and purchased a setting of eggs. From this setting I succeeded in raising nine chicks, five cockerels and four pullets. These birds were the foundation of my strain.

Up to this time I had been breeding one of the popular heavy breeds. I kept these along with the Campines for two years as an experiment, keeping a careful record of eggs laid and feed consumed. At the end of the second year I found the Campines so far in the lead that I decided to discard all of my other birds and keep the Golden. I have bred them exclusively ever since.

The Campine is the national fowl of Belgium. It is from the La Campine plains of this country that the Campine gets its name. These plains are a sandy tract of land, covered with scrub vegetation, and in order to exist there the birds have to be active and rugged.

Although originating in the Campine district, from which they are named, they were previous to the world war to be found scattered throughout Southern Holland, in the Rhenish provinces of Germany, and in Northern France, besides being extensively bred in England.

As to the origin of the Campine, it is conceded that the stock has been in existence for several centuries. The first description of a breed resembling the present Campine was in a work on natural history published about A. D. 1600, in which it was called a Turkey fowl, found in Flanders. So much for the Campine historically.

For the fancier its graceful form, covered with greenish black feathers, with golden bars; neck or hackle feathers golden in color; white earlobes; bright red face, wattles and comb, make a picture worthy of the brush of an artist. For the poultry raiser who seeks profit in the market, the large and abundant white eggs produced on a very small amount of feed, assure him an ample income. As in Flanders for centuries, the Campine is still the every-day layer.

The Golden breed very true to type, without resorting to double mating. My first prize cockerel and first pullet at Madison Square Garden this winter were from the same mating.

If one is so situated as to give them unlimited range, they will pick up the greater part of their food, although they do very well in confinement, becoming as tame as kittens, often flying on to the arms and shoulders of the attendant when he appears at feeding time.

For best results they should be housed in large quarters, with plenty of fresh air and light, with opportunity for plenty of exercise, which can

Conkey's baby chick starter, a wonder for starting the chick. Order a package with your chicks. A complete line of Conkey's remedies, also brooder stoves and equipment of all kinds. Hard coal for your brooders if desired.

P. F. CLARDY, Box A, ETHEL, MO.

be brought about by having plenty of good deep litter in the coop. Yet it has been proven that if one has a small space for carrying on the poultry business, the Campines will give excellent results, as they can be confined in small quarters and still retain their health and produce lots of large white eggs. This is due to the exceptional hardness of the breed and their great activity under all conditions.

To their great activity can be traced the good fertility of their eggs, and the rapidity of growth of the chicks, which literally grow like weeds from the time that they pip the egg shell until maturity.

The little cockerels often attempt to crow when four weeks old.

For best results the chicks should not be fed for at least thirty-six hours after being hatched. The first feed may be composed of bread crumbs and a little hard boiled egg; with this may also be given a little fine grit or sand, together with a drink of water from which the chill has been removed.

After a couple of days they can be gradually worked on to any good commercial chick feed. At this time they should also be given a little green feed, if they are confined where they cannot get their own green feed. Greens are just as essential to rapid growth as grain. They should also have a mash of some kind. I have the best results with one of the best known commercial mashes. This is fed to the chicks dry and is kept before them in shallow trays where they can help themselves at any time. A little fine charcoal is also mixed in the mash; this acts as a bowel regulator and is very essential.

It is certainly a pleasure to work with the lively little Campines. One can almost see them grow, and almost before you realize it the little cockerels are attempting to crow. The sexes should now be separated, as the pullets will do much better if kept away from the annoyance of the cockerels. The cockerels can now be marketed as broilers, while the pullets can be given the attention and room, a part of which up to this time, had to be given the cockerels.

Campines are very small eaters, and will not do well on heavy feeding. It is surprising the small amount of feed that it takes to keep a flock of Golden Campines healthy and in a laying condition. I am often asked why I breed the Golden Campines, and to name their good points, which are briefly as follows: Among the most beautiful of our feathered friends; great layers of large white eggs; very small eaters; good foragers; hardy and active; early to mature and strictly non-setters.

I think that there is a great future in store for them. The interest in them is growing by leaps and bounds, and the supply does not keep pace with the demand. In conclusion I wish to say for the benefit of any one who is thinking of taking up the breeding of fowls for pleasure or profit, or both, or for any one who is dissatisfied with the breed that they are now keeping and who would like to make a change, that you cannot go wrong in choosing the beautiful Golden Campine.

All our pens are made up of prize winners on both sides, and the best money can buy in the way of baby chicks is offered at \$1.25 each. Order now.

And remember that a farm of world-wide reputation stands behind every deal. Every customer MUST be pleased, no matter what trouble and expense we have to go to.

BLUE ANDALUSIANS.

By WALTER C. DOBE.

All popular varieties of fowls today, in both showroom and yard, must pay their own way, earn a good profit, and possess attractiveness that will appeal to the most exacting. In Andalusians we have a variety for the utility poultryman and fancier—a variety that will make as much or more money for the utility breeder as any breed, and a combination of color that will appeal to almost any fancier of artistic taste.

Andalusians belong to the Mediterranean family and have for their nativity the province of Andalusia, a southern part of Spain. Before being introduced into England the females carried low, game-like combs. Shortly after, English breeders crossed them with Minorcas, which increased their size as well as the size of their combs. The game-like appearance seems to have been characteristic of the breed ever since it originated. This gives a distinctive type, getting away from Minorca and Leghorn shape.

The Standard weights of Andalusians are: cocks, 6½ pounds; hens, 5½ pounds; cockerels, 5½ pounds; pullets, 4½ pounds. However, winning birds at the leading American shows are running considerably above these weights without making them appear coarse in construction. The general carriage of the Andalusians should be upright, and after observing several generations we find that females having upright carriages are apt to be the best egg producers.

Blue As a Color.

Since blue is not a natural color, but a modified black, the Andalusians have a tendency to throw a few off-colored chicks; but the show birds will number as many as in any other breed out of the number hatched. If every chick produced would come true to type and color there would be no fun in the chicken business. It is the exceptional specimens for which the breeders are striving.

The color scheme of the Andalusians is a medium blue feather with edging or lacing of a darker blue. The ground color should be free from smut or ticking as well as shafting. Dull, smutty specimens are objectionable, as are those lacking distinct lacing. Each feather in each section of both male and female should be laced with a very distinct edging of dark blue, clearly defined, excepting, of course, the saddle and hackle of males, which should be of good length.

In mating this variety we find best results are obtained from mating together males and females of as near Standard color as possible, and by mating dark blue to light blue—this spelled with a capital B. The females must be of even ground color throughout, free from smutty or dark feathers on breast or wing. Lacing should carry down to the fluff.

While it may be true that a good percentage of Blues may be produced from mating black and white Andalusian sports, yet this is not to be advocated. A blue hen produced from a sport mating will throw more off-colored chicks than one bred from a mating of Blues. The breeding of good Andalusians is really an art and should be done in a systematic way. A definite standard should be had in mind toward which to work with the ultimate expectation

All dealers 30 cents, or direct by mail 35 cents.

J. H. REED & SON

PARIS, ILLINOIS

of securing better type, color and size in the next generation. When judiciously mated the Andalusians breed remarkably true to type.

Future of the Variety.

There can be no denying the fact that Andalusians are fast gaining in popularity. The size, weight and quantity of eggs they lay, with their many other sterling qualities, have caused breeders of other varieties to take them up, and today it is pleasing to note the vast increase in the number of Andalusians being kept both for profit and pleasure.

As layers of big white eggs in large numbers, Andalusians cannot be surpassed, and the fact they seldom care to sit affords greater time for production. They excel as all-year-round layers, because with proper management they will lay as well in winter as in summer, making the total value of their eggs for the year very high. Mature fowls give splendid results when kept in close confinement on the village lot, but if given free range make excellent foragers.

The chicks are hardy and precocious and can be easily reared without special attention. Well matured pullets will commence laying at about six months of age, and it is not unusual for them to continue laying right through the molting period. Andalusians are a long lived race of persistent producers. At three, four and even five years of age they will lay a profitable number of eggs, which eliminates the necessity of replacing layers every year or two.

As a table fowl they are noted for the rich, juicy breast meat which is found in abundance on their deep keel bone.

In the showroom they are much admired by the general public. The handsome appearance of nicely laced birds, with clear blue ground color, bright red comb, and white ear lobes, forms a most attractive sight. Aside from washing the face and comb and cleaning the legs, the Andalusian requires little preparation for the showroom.

The Andalusians have never enjoyed a real advertising boom, but have increased in popularity solely on their merits. The demand the last few years for stock and hatching eggs has been much greater than the supply, which accounts somewhat for the absence of more advertisements appearing in the poultry press. A well worded five or ten dollar ad inserted in one of the poultry journals of large circulation will sell all the eggs that a small flock of Andalusians will produce during the hatching season.

The demand for this variety of fowls is rapidly increasing and the future is very bright. A fertile field in the Andalusian business, with unlimited possibilities, is afforded the utility poultryman or fancier to derive handsome profits from a small pen or large flock of Andalusians.

In conclusion, let me say, if you are not satisfied with the results you are now receiving from the birds you now have, or if you contemplate keeping poultry for both profit and pleasure, procure fowls or eggs of as good stock as your purse will permit, and get birds with established blood lines, and I think you will form the same high opinion of the Andalusians as the writer.

Reliable Blue Flame Coal Oil Heated Colony Hovers

At it 40 Years—Our 40th Anniversary

Why Not Buy Goods That Have Been Tested and Found True to Name, RELIABLE?

OUR MOTTO IS AND ALWAYS HAS BEEN, QUALITY FIRST, LAST, AND ALWAYS

WE, THE RELIABLE INCUBATOR & BROODER CO., POSITIVELY GUARANTEE EVERY HOVER SENT OUT to be just as represented and to give perfect satisfaction or money refunded, as per guarantee in each Reliable catalog.

HOW OUR HOVERS AND HEATERS ARE MADE AND SHIPPED.

Every canopy that goes out on our BLUE FLAME HOVER is put together doubled seamed, lapped and pressed with a heavy iron rod turned in around the entire bottom edge, with a cast iron ring bolted around the top where our special raised ventilator fits in snugly. We furnish with each hover four double legs, made of angle iron, with two bolts in each leg; these hovers are neatly crated so that they can be nested, so as to save freight charges. Each and every heating outfit for this hover is put together entirely at our factory with the oil fount and burner neatly wrapped so no dirt can have access to the pipes, and boxed tight. We furnish a brass drip valve with double clean-out so sediments and paraffin in the oil can be easily cleaned out without closing off your heat. We ship all our Blue Flame Oil Hovers and Heaters fully assembled; hovers crated; heaters boxed. In buying a hover always ask if the hovers and heaters are reinforced with heavy iron rod at the bottom or if they are shipped out in knocked down shape to be bolted together after you receive them.

All that is necessary when you receive a RELIABLE OIL HEATED HOVER is to uncrate the hover, bolt the legs on, put the ventilator in the top, take the wrapping off of the burner and oil fount, fill your glass oil reservoir, set in place, turn on your oil, when your asbestos lighting ring is saturated, touch a match to it and it will generate and burn a Positively Blue Flame without smoke or fumes.

Metal Covered Asbestos Vaporizer

State size burner when ordering.

Price Post-paid, Only **15c** each

Our Asbestos Vaporizer or lighting ring has asbestos in center with a layer of perforated metal on each side, which works to perfection and eliminates the use of dangerous gasoline or alcohol and is as easy to light and generate as it is to light a house lamp, with no more danger.

All Metal Vaporizer

State size burner when ordering.

Price Post-paid, Only **25c** each

If any one wants to test out or even thinks that an All Metal Vaporizer is of any value whatever in a Reliable Blue Flame Burner, we will furnish one for only 25c postpaid anywhere in the United States or Canada. In using this All Metal Vaporizer you must generate with gasoline or alcohol.

Notice—Important THE RELIABLE BLUE FLAME OIL HEATER WILL generate and burn a solid Blue Flame, just as good without any asbestos or all metal vaporizer if you use gasoline or alcohol to generate with, but with the RELIABLE ASBESTOS VAPORIZER covered with metal you eliminate the use of dangerous gasoline and alcohol.

Rockville, Connecticut, Jan. 4, 1921.
Reliable Incubator & Brooder Co.,
Quincy, Ill.

Gentlemen: Good for you! That was a solar plexus blow you delivered to the All Metal Vaporizer. We have been using the Reliable Oil Burning Brooders for two years and have found them far ahead of any other brooder for DEPENDABLE qualities. The asbestos lighting ring works like a charm and we have had splendid success with these brooders. We have discarded all of our coal burning brooders in favor of your oil burning brooders of the same capacity. Last season we had 3,300 chicks to brood and this season we may have as many if not more. Coal burners are too expensive when coal costs \$21.00 a ton and poor quality coal at that. We will need more oil burning brooders.

We have no faith in a metal lighting ring, and do not want anything that has to be coaxed with alcohol or gasoline. Kindly send us your catalog and prices.

Yours truly,

Hugh Ballantyne, Mgr.

Meadford, Ont., Canada, Jan. 11, 1921.
Reliable Incubator & Brooder Co.,
Quincy, Ill.

Gentlemen: I received copy of the Poultry Keeper. I note what your rival claims on the metal ring, etc. Your answer pleases me. You have struck out right from the shoulder; it would be well for the public if a few more of these spell binders got a knock out such as you have handed them. Your improved Asbestos Lighting Ring with a thin strip of perforated metal on each side of your asbestos is far ahead of anything that we have ever used. I have one of your hovers and am operating it and have no trouble whatever with my asbestos lighting ring, and I intend to have more of your Reliable Blue Flame Oil Hovers this season. The one I have is working to perfection.

Yours truly,

W. F. Johnston.

**Burns Coal Oil
No Wick to Trim
Steady Blue Flame
Abundance of Heat
Comfortable and Easy to Operate
No Oil Fumes Visible, Oil Feed Convenient and Safe
Economy of Operation
No Coal Smoke or Gas
The Flow of Oil is Regulated Automatically.**

This is the most popular and most efficient hover ever manufactured, as proven by the many testimonials received.

You can always get coal oil, but it is hard to get hard coal. You can get any amount of heat with these hovers that is needed at all times.

Thirty Thousand Reliable Blue Flame Wickless Oil Heated Colony Hovers sold last season and every customer satisfied and is a booster.

Can be operated successfully without a lighting ring by generating burner with alcohol or gasoline, but burns less oil by using asbestos lighting ring. We furnish lighting rings with each outfit.

We furnish a one gallon self feeder so that you need have no fear of light going out, for it is simple and requires very little attention. It is equipped with a safety valve. After the valve is once properly adjusted you need not pay any more attention, for it regulates the drop of oil. Our Ventilator in top of cone of hover leaves out all foul air made by the chicks. This is done automatically without any bother to the operator and which insures steady and healthy growth of the chicks placed in its care.

By using the Reliable Blue Flame Wickless Oil Heated Colony Hovers you save time, money and trouble and your chickens will grow faster, get heavier and thrive because our hover will take the very best care of them and keep them comfortable, happy and healthy.

Our guarantee is that any goods bought of the Reliable Incubator and Brooder Company, will do as we claim for them; if not, and returned by the purchaser within sixty-days, your money will be refunded. Send for catalog and prices. It's free.

1921

LIGHT BRAHMAS FOR A HALF CENTURY.

In the 56 years I have bred Light Brahmas I have seen a great many changes. The Brahma I first bred was a very tall slow feathering, slow maturing, awkward chicken. As cocks they were very large and grand. I remember a cock I saw in one of E. C. Comey's breeding pens that weighed 18 lbs., not over fat, very active and vigorous.

These early day Brahmas were very light in color. The hackles, tails and flights were the only sections in which black was allowed. Heavy striped hackles and nice laced tails would have disqualified them there.

They were the most popular breed of all the fancy at that time. Everything was sailing along fine and nearly everybody bred Brahmas.

Some scheming ass introduced cocky blood and they went from an elegant, large useful bird to a low-down, squatty, loose feathered, sluggish bird, without beauty, vigor, or usefulness. That came very near being the end of Light Brahmas. But a few of the old breeders kept the true Light Brahma type; and with the improvement in color, they are coming to their own again.

With the quick maturing, heavy laying, almost non-setting Light Brahma as bred today, there is no reason why they should not be one of the most popular breeds for utility and fancy.

F. C. Nutter.

Correction.

The ad. of Prospect Farms, 56 Ferry St., Newark, N. J., page 227 of the February issue, listed this Farm's winnings on Indian Runner ducks, whereas Prospect Farms exhibited and won on Pekin ducks.

A Chick From Every Egg

is my guarantee on our mated yard eggs this season; in fact, our EGGS FOR HATCHING GUARANTEE is the most liberal ever offered by any breeder. If you contemplate buying eggs for hatching don't buy until you read my guarantee; it means money for you.

U. R. White Plymouth Rocks

are in greater demand than ever before. The cause for this is they are conceded to be the very best in Standard Bred Poultry. When keeping poultry keep the fowl that will produce the most eggs and meat on the least feed. U. R. Fishel's White Plymouth Rocks will do it.

Selected Breeders and Utility Fowls

at reduced prices. Don't forget I have REDUCED PRICES ON BABY CHICKS, and safe arrival guaranteed.

Send for my new catalog; it is free. Write me your wants. Remember my White Plymouth Rocks are "THE BEST IN THE WORLD." Eggs, \$5 and \$10 per 15; \$15 per 50; \$25 per 100.

HINTS ON MANAGEMENT.

A paraphrase of the old hymn might read "The Mistakes of my life have been many, the sins of omission have been more." In poultry raising as well as in life this is true; and while this may not be timely it may prevent some of the things that happened this year from causing us both sorrow and loss next year.

First, overcrowding as the result of hatching more chicks than we have room to grow to a marketable age. One of the first things that a beginner must learn is never to hatch all the chickens he wants at that time. Did you ever cook beans? Well if you have you know that the finished product is away out of proportion to the amount with which you started. Fifty is a big number for an ordinary backlotter or most beginners if they wish to avoid overcrowding. Never permit half that number to roost in the same coop nor in the same quarters, at least till they are grown.

Second, mites are a constant source of loss not only in the slow development of the bird but also in the color and texture of the feather. A pound the month in the American breeds is as little growth as one should expect if the conditions are at all satisfactory. If you are not getting that amount of growth, something is wrong. Look at once to your feed and quarters. Keep your roosts clean and spray with kerosene at least once a week. Use air-slaked lime to kill off the mosquitoes, which in most houses make life miserable for the fowls, especially in the late summer and early fall. Sore-head, chicken-pox and roup are often directly traceable to the sting of the mosquito. Keep them out of the houses and coops. Lime and kerosene will do it for you.

Third, keep their quarters dry. Be sure the roof does not leak, that rain does not blow through the cracks, and above all that the sunshine can reach practically every part of the floor of the building, and that it does do it. Keep straw or dry leaves on the floor to absorb any dampness that might obtain and change this litter often. An earth floor is the best floor if it may be kept dry. Don't neglect, don't put off, don't procrastinate. Do it now.

Is raising prize winners your ambition? There is no royal road. Alike the peer and peasant must climb to her abode. No one has ever reached and kept the place except through close attention to the little details and these before mentioned ones are the big keys to success.

A good quality of clean food is essential to their good health. Feed table scraps right from the table only, never let them accumulate and don't use those from your neighbor unless they are as careful about them as you are yourself. If you feed a wet mash, and it is good for them, do not feed more than they will clean up at once and feed it only in a clean place. Keep a dry mash before them at all times after they are a month old. If they are inclined to get weak in the legs, your food does not contain enough bone-making ingredients. Feed dry cut bone, and use a little lime in the water. Put lime in the water and pour off the water after the lime settles. Keep plenty of finely ground oyster shell so they get it any time they wish.

All this is old stuff, and mere detail

Can I really learn the poultry business by mail?

Yes! Eleven of America's greatest poultry experts, successful both as poultrymen and teachers, have created the Interstate Poultry School Home Study Course which will give you the needed training at home.

How can I make money growing market poultry?

Let Prof. Hare show you. (Late U. S. Dept. of Agriculture and Clemson Agricultural College.)

How can I get a heavy egg yield the year round?

Harry Forster has done it and everybody knows he has. Let him tell you.

How shall I select my breeding stock?

Nothing more certain in the world. Let T. F. McGrew tell you. (Poultry breeder, judge, writer, lecturer.)

How can I prevent and control poultry diseases?

Prof. G. D. Horton will tell you. (Late Oregon Agricultural College, Missouri Poultry Experiment Station, and U. S. Dept. of Agriculture.)

What's the best method of raising baby chicks?

M. L. Chapman knows, and he has proved he knows. Let him tell you. (Supt. Wilburtha Poultry Farms, President White Leghorn Club.)

What's the difference in poultry work in Canada, the Mississippi Valley, and Florida, for example?

Let Prof. F. C. Elford tell you. (Poultry Husbandman Dominion of Canada.) Let Prof. A. F. Rolf tell you. (Late Oklahoma Agricultural College; U. S. Dept. of Agriculture; Secy. White Leghorn Club; Editor Modern Farming.) Let Dr. N. W. Sanborn tell you. (Prof. of Poultry Husbandry, University of Florida.)

How can I learn modern poultry methods from A to Z?

Prof. F. H. Stoneburn, Late Prof. of Poultry Husbandry, Connecticut Agricultural College; John S. Martin, one of the world's foremost poultry breeders; F. L. Benedict, expert in poultry production and marketing methods, together with the entire faculty, will teach you as they are teaching ambitious poultrymen everywhere.

Whether you are only contemplating going into the poultry business, or running a backyard flock, or are in the business on a commercial scale, you can profitably use the experience and specialized knowledge of these men. Positively you can get it all by mail. It is being done by others every day. Just one thing to do—send in the coupon below. The next mail will bring you all the evidence and full details of how we do it. (This Interstate Poultry School Course is one of the many home study courses offered by the United Y. M. C. A. Schools.)

The High Grade Material of Interstate Poultry School and the Practical Service Methods of the Y. M. C. A. make an unparalleled combination. You can't beat it.

Correct Type and Color of Rhode Island REDS

BY means of the most remarkable set of Rhode Island Red illustrations ever produced, W. H. Card, secretary of the Rhode Island Red Club and the greatest living authority on Reds, in "Blue Ribbon Reds," shows in a way so simple that every beginner can understand what constitutes the correct type and color of Rhode Island Reds. There are twelve drawings illustrating type and fourteen illustrating color. These drawings show the ideal Reds, both male and female, as well as the various shape and color defects most commonly found. Mr. Card also points out which defects are serious and which are of only minor importance.

Other subjects in this wonderful book on Rhode Island Reds are:

- An A-B-C course in judging Rhode Island Reds. (In five lessons).
- How Rhode Island Reds originated.
- Mating Rhode Island Reds for Color and Shape.
- How to obtain fast growth and large size on Rhode Island Reds.
- How to breed up an egg laying strain.
- How to cull Rhode Island Reds.
- How to prepare Rhode Island Reds for the show room.
- Which is the correct Rhode Island Red color.
- Disqualifications.
- Standard weights.
- Feeding Poultry at all ages.
- Linebreeding.
- How to treat sick fowls.
- How to get rid of lice and mites.
- How to build poultry houses and equipment.

Special Illustrated Features are the following

A picture of Rhode Island Reds in natural colors, suitable for framing, the latest and best ever published, copyrighted 1919. Pictures of many prize-winning Reds at National Shows. Description of a common sense window for fresh air poultry houses and detailed illustrations made from blue prints—How to build a practical poultry house for a small flock of chickens. How to make a good homemade trapnest.

There are many other articles of unusual interest and value in "Blue Ribbon Reds." You will have to see a copy of this great book in order to appreciate it. It is a veritable encyclopedia of useful poultry information, produced at a cost of \$3,000.

THIS remarkable book will be sent free with a three year subscription to the RHODE ISLAND RED JOURNAL at \$1.00, if you clip this ad and send it with your name and address.

...THE...

Rhode Island Red Journal

is the official organ of the Rhode Island Red Club of America, published monthly, at 50c per year. It is the "Red Breeders' Bible," and those who know it say they would not be without it for \$5 per year. It keeps you in touch with all the leading breeders of Reds and keeps you posted on everything pertaining to Rhode Island Reds.

Rhode Island Red Journal
4031 E. Bremer Ave.
Waverly, Iowa

to experienced poultrymen; but it can never be impressed too firmly on the mind of those starting in poultry. No matter from what stock you grow your chicks, nor what kind of mating you use, nothing will take the place of good care and wholesome food. There have been prize winners grown from mediocre parentage, by the above rules.

To sum up the whole matter, never permit the chickens to crowd. Prevent this by hatching only as many chicks as you have room enough for, when they are of marketable age. Keep quarters clean, dry and free from mites. Do this by keeping the roof tight, the litter fresh and clean and spray the roosting places. Use only wholesome food.

Illinois.

L. E. Rouch.

Our Cover.

The remarkably big, long-bodied male on the front cover this month is the Single Comb Black Minorca cock that headed the first old pen at the recent Madison Square Garden, New York, Show.

The breed is supposed to have come originally from Minorca, which is one of the Balearic Islands, off the coast of Spain. For a considerable time the Minorca was known as the Spanish fowl, and later as red-faced Spanish. The White Minorca cross as sports of the Black variety. The rose comb Minorcas are generally believed to have some Black Hamburg blood in them.

The modern S. C. Black Minorca is much larger than the original stock of one hundred years ago. The Standard weights for S. C. Black Minorcas now are: Cock, 9 lbs.; hen, 7½ lbs.; cockerel, 7½ lbs.; pullet, 6½ lbs. It is not uncommon to find winning cocks and hens in the leading shows that weigh one pound over Standard weight.

The Black Minorca has black or slate colored shanks, white skin and lays a large, white-shelled egg. The comb of the male should be large, even upon the head, free from wrinkles and twists and have six well defined points.

The wattles should be long. The earlobes, large and almond shaped, and pure white. The neck should be rather long and well arched; the back long, and slope slightly to tail; the tail large and well spread and only moderately elevated.

Some breeders like a long leg, but cockerels of such breeding are often inclined to weak legs. The Standard calls for a long shank but a medium length of drum stick; and the bone in the leg should be strong.

The back should be broad and the breast full and well rounded. These features are not often seen in very long legged cockerels. Breeders should stick to the true type of long, squarely set bodies. The picture on the cover is a good model.

Fertility from a Back Yard Flock.

Last year I had six pullets and one cockerel penned up in the back yard.

The poultry house and yard were on the north side of the coal shed. The house was about five feet long, four feet wide, four feet high in front, and three feet in the rear. No windows in it for light. A small opening led into the yard. The yard was about five feet wide and ten or twelve feet long. Not very good quarters, but I got fertile eggs.

Out of 57 eggs set only two were infertile. There were eight chicks that died in the shell. This leaves 47 living chicks out of 57 eggs, or 82% of living chicks out of the 57 eggs.

I set the hens in a box half-filled with dirt and a little hay on top of this. I twice dusted the setting hens with lice powder.

I fed the laying hens table scraps and a mixture of corn, wheat and oats. I would let the chickens out late in the afternoons and would herd them around so they did not bother the neighbors. I gave them plenty of fresh, clean water mornings and evenings. I would often dig around in the garden and the chickens were usually there to pick up the fish worms. The chickens had plenty of green food. I kept their yard spaded up.

My chicks proved to be mostly pullets, and are now laying fine.

I have found that you can get good fertile eggs if chickens are shut up, but I would not advise keeping them shut up if one could let them run. In other words, chickens will do good under most any condition that they are put.

GEO. EARLES.

1887 DAY-OLD 1921 CHIX -- DUX

From Maine to Florida, from the Atlantic to the Pacific, in hamlet, town, suburb and city, you will find flocks of Niagara Farm chicks giving an excellent account of themselves in the hands of our customers.

Anconas, Barred Rocks, White Rocks, White Wyandottes, R. I. Reds, Black Minorcas, White, Buff and Brown Leghorns, Mammoth Pekin and White and Colored Indian Runner Ducklings, hatching on every Monday and Wednesday of each week, beginning March second.

Niagara Falls, N. Y., Feb. 10, 1921.

Gentlemen:—

Please enter my order for 3,000 day-old chicks for delivery May 15, for which I inclose herewith our check for 50%, less discount. From 400 pullets raised from White Leghorn chicks purchased of you last season I gathered 5,235 eggs during the month of January. Yours truly,

NIAGARA UNIVERSITY FARM.

Pittsfield, Mass., Feb. 8, 1921.

Gentlemen:—

The order for day-old chicks and ducks placed with you last season proved a wonder. NOT ONE LOST, and all raised to maturity. Send your prices for this year, please.

Yours truly, E. C. STONE.

Chateaugay, N. Y., Feb. 1, 1921.

Gentlemen:—

Kindly quote prices on 200 S. C. Anconas. Pullets raised from chicks purchased from you last season were whirlwinds to lay, and I want at least 100 pullets this fall.

Very truly yours, W. G. MURRAY.

BARTON SUPERIOR BABY CHICKS

Hatching February to July. Send now for price list THE BARTON HATCHERIES, Dept. A328 EVANSTON, ILL.

Getting Good Hatches.

Good chicks can be hatched only from eggs produced by hens properly mated and kept under the best possible conditions to secure health and vigor. Eggs from over-fat breeding birds do not produce a large percentage of strong chicks. Hens that have been resting during the winter months are in better condition to produce husky chicks than pullets that have been forced for egg production.

It is generally understood that not every egg collected is suitable for incubation. Eggs for hatching should be carefully selected for uniformity of size, shape and color. Eggs with thin shells or rough surfaces, and those that are over-sized or too small should be used for table purposes, as they seldom hatch and never produce strong, healthy chicks. Eggs for incubation should be kept in a cool, dry place, and storage should be for as short a time as possible. During the time they are

being held for incubation, eggs should rest on their side and should be turned daily to prevent the yolk from settling.

As the value of an incubator is small compared with the value of the eggs used during the normal life of the machine, it is poor economy to purchase one which is not reliable. Whenever possible it is well to select an incubator which is giving good satisfaction in your vicinity, so that you may get the experience of other operators in your section.

First Young Pen R. C. R. I. Red Cockerel at Minneapolis Show, 1920.
Owned by H. F. Garbisch, Austin, Minn.

First Prize Buff Orpington Cock at National Show, Chicago, Jan., 1921. Owned by Bonnie Brae Orpington Farm, Sandusky, Ohio.

BARRED PLYMOUTH ROCKS

Close of Season Sale

Our First Pen Male, Boston, 1917.

Dark Mating stock, 20 Cocks, 200 Cockerels. Females to match—Superb Pullet Bred specimens, both sexes.

Birds \$10 to \$25 and upwards

Money's worth. Prompt shipments. These are winning lines shown in many recent shows, direct from our yards or bred from such. Orders now booked for EGGS from best pens, even better than for years.

**\$16.00 per 15—\$21.00 for 24
\$31.00 for 39, prepaid**

No baby chicks. Mating list to appear in March issue National Plymouth Rock Journal.

Remember our record for honesty and square dealing and for producing First Prize Winners for Garden and Boston Shows.

Bradley Bros., Box 810, Lee, Mass.

CHICKS AND EGGS FROM SANDY'S White and Black Orpington Winners

If you want winners for next season, you must have chicks and eggs from parent stock that has won high honors at Philadelphia, Hagerstown, Kansas City, Virginia State Fair, South Carolina State Fair, Washington, D. C., and Pittsburgh, Pa.

Eggs and Chicks from these matings will develop into winners at next season's best shows. Our prices are very reasonable.

Eggs from extra fine matings—\$15 for 15; \$25 per 30. Eggs from championship matings—\$10 for 15; \$17.50 for 30.

Utility eggs in lots of 15 to 1,000.

We guarantee absolute satisfaction and prepay all charges to your door. Mating list free. Book your order today for immediate or deferred shipment.

A New Book—Published 1920

Mating and Breeding of Poultry

By **HARRY M. LAMON and ROBT. SLOCUM**

**SENIOR POULTRYMAN
U. S. Department of Agriculture.**

340 pages on how to mate and breed all Standard varieties of chickens, based on the experiences of 81 leading American breeders. Nothing like it ever before published. A companion book to the Standard of Perfection, telling how to produce in full perfection every breed described in the Standard. Fully illustrated with ideal birds and feather charts. Following are only a few of the subjects:

Linebreeding, Inbreeding, Variation, Influence of Sire and Dam, Control of Sex, Prepotency, Mendelism, Selection for Vigor, Introducing New Blood, Single Mating, Double Mating, A Fixed Plan of Breeding, Establishment of Blood Lines, Breeding Birds with Defects, Pedigreeing, Alternating Males, Age of Breeders, Record of Matings, Size of Mating, Breeding Condition, Culling, How High Egg Producing

Ability Is Inherited, Breeding from an Untrapped Flock, Breeding from Trapped Stock, How to Mate Every Variety of Plymouth Rocks, How to Mate Rhode Island Reds, How to Mate Every Variety of Wyandottes, How to Mate All Leghorns and Orpingtons, How to Mate Every Variety in the Standard.

Successful Breeders Endorse This Great Book.

E. B. Thompson says: "The best on the mating and breeding of poultry that has ever been published and will prove to be invaluable to thousands of people."

H. C. Sheppard: "A remarkable work as it covers the ground thoroughly and efficiently."

H. B. Hark: "It will put the beginner on his feet from the very start and he will not have to breed poultry four or five years to find out whether he is right or wrong."

This is an entirely new and original work, ready for distribution. PRICE, \$2.50 PER COPY. 340 pages of heavy book paper, cloth bound, profusely illustrated.

C. S. Byers: "A revelation in Standard fowl breeding with a key to the Standard."

F. H. Davey: "It should be in the hands of every person in America who breeds poultry."

W. H. Card: "Its accuracy recommends its contents to every expert."

John S. Martin: "It covers thoroughly the perplexing points that are continually coming up in breeding."

Every breeder should have a copy. Now COPY. 340 pages of heavy book paper,

Hen vs. Pullet Eggs for Hatching Purposes.

A reader of American Poultry Journal, T. B. Cole of Idaho, recently wrote to a number of prominent breeders inquiring if they considered pullets equal to hens for breeding purposes. The replies that he received follow:

"I do not find any difference between pullets and hens for breeders if the pullets are well grown and well matured; in fact, some of the best birds I ever reared came from pullets. I like cockerels better for breeding than cocks, for so often the cocks will not fertilize the eggs properly or at all. I use cocks, but am always worried about the eggs till I have tested them for fertility."

Very truly yours,

"Your letter of January 29 received. I do not think there is any difference in the use of one and two-year-old females for breeding purposes; nor does it make any difference in your breeding results whether the males and females are of the same age. I do believe that it is advisable not to breed cockerels and pullets together if they are not well matured."

Very truly yours,

"In reply to your letter beg to state that hens will make better breeders than pullets, because they will produce better and more vigorous chicks. It is not necessary that the male be of different age than the female in order to get satisfactory results in your breeding pen." Very truly,

"In reply to your letter will say that there is a difference between pullets and hens for breeders. If pullets are early hatched they will make good breeders. If not worked too hard through the winter they may be mated to a cock or early cockerel; either is good. Hens two years old that have not worked much through the winter produce stronger chicks; and for my best breeding I always use hens that are not less than two years old."

If you have a pullet that is a show bird when she is a pullet, she may molt out of it when a hen. If you have got a hen that held her color through the molt you have something that you can depend on. The same with a cockerel, but cockerels generally hold color, except in wings, where they most always molt lighter." Very truly yours,

"Your favor of the 28th ult., has been received and carefully read. It makes no difference whether a cockerel or cock is mated with hens or pullets; the main thing is the quality of the birds. I have matings of cocks on hens, cockerels on hens, cockerels and pullets and cocks on pullets. I can see no difference in the results, the quality is the deciding factor." Yours very truly,

"Replying to yours of January 29, 1921, there would likely be some difference as between pullets and hens; good vigorous pullets would lay you considerably more eggs than hens. The hen eggs would hatch bigger, stronger chicks. It is usually best to mate a cock bird with pullets and a cockerel with hens, although in both instances the individual birds would have more to do with breeding qualities than the eggs." Yours truly,

Chicks Need Roughage.

Plenty of roughage must be accessible to the chicks. Provision for green feed and plenty of exercise will not prevent leg weakness if the bird at the same time is overfed a concentrated ration. Plowing the poultry yard in the spring so that the birds may be on freshly-turned earth helps because the chickens eat considerable amounts of dirt. But some roughage is just as essential in successful rearing of poultry as protein, carbohydrates, fats and vitamins. The fiber of plants seems to have some real value, and evidently the liberal use of wheat bran in chick feeds finds justification. It is not necessary to feed paper, but roughage such as wheat bran, clean clover chaff or some similar material should be provided.

American Poultry Journal - - 523 Plymouth Court, Chicago, Illinois

MY EXPERIENCE WITH WHITE PLYMOUTH ROCKS.

In the spring of 1915 I finished a commercial course at a business college. I started work as bookkeeper in the bank at our town in September of the same year.

About this time there was organized in town a poultry club of specialty breeders. I joined the club with White Plymouth Rocks as my breed. I wanted White Wyandottes but some one else had taken them. My mother used to keep Barred Rocks, and as long as I knew more or less about Rocks I decided to take White Rocks. I have not been sorry at all that I chose them. I am sure as a general-purpose fowl there are none better. They are large and are good layers. They won first honors at the 1919 Missouri Farm Flock Laying Contest over all breeds.

The next thing for me to do after I chose my breed was to purchase some stock or eggs of a reliable breeder, but this I found was no small task. In the end I bought a trio of a breeder that was recommended to me. The trio consisted of a cockerel, a pullet, and a hen. The cockerel and hen were real good birds, the pullet was of good color and type but did not develop as large as she should.

I bought the birds the first of the year, so I had them during some of the real cold weather. If a person expects to get early eggs in the spring, the hens must have proper care, also proper food. In the real cold weather, especially when there is snow on the ground, the hens should be kept in the house and one wants to keep lots of litter on the floor of the scratching pen. If there

is plenty of work about getting their food they will be that much better off. Two good ways for exercise are to either hang a mangel about 15 inches from the floor or else hang a bundle of unhusked corn with the ears partly husked. They enjoy jumping and pecking at the swinging food.

As soon as the ground thawed out so I could dig holes I set posts and made a park. It was about one rod wide and three rods long. This made a good run for the three birds. This park was large enough so they had some green food all summer.

I kept for setting all the eggs the two hens laid. I set them all under hens and hatched and raised sixty chickens from the two breeding hens. I thought that real good. About the 10th of May I sent for a sitting of eggs. From them I hatched twelve healthy chicks. I toe-marked these so I would know them from the other ones. I will say right now that I think that toe-marking is a very good way to keep records of certain birds.

I took the best of care of my young chicks and they grew and developed into big nice birds. In the fall the club decided to send a carload of birds to the West Michigan State Fair at Grand Rapids, in September, 1916. I looked my flock over and picked out and sent one pen, one pullet and my cock bird. To my surprise when the report came back, every one of my birds had won a ribbon. I got 2d cock, 2d pen and 2d pullet. I felt real encouraged I can assure you. When the birds came back I found the cock bird had taken cold during the show. I took good care of him but he died in about two weeks.

This sort of knocked the glory out of my winnings. But I kept on.

The following January I sent seven birds to the Albion show and won 1st pen, 2d cockerel and 2d pullet. This, of course, encouraged me quite a lot.

he next fall, September, 1917, I sent four birds to the show at Jackson and won 1st cock and 2d hen. During the winter of 1917-1918 I sold several single birds, one pen and 100 eggs. This helped meet some of the expense I had been to in the past year. The fall of 1918 I won 1st cock at Jackson in a good class.

Since the fall of 1918 I have not sent any birds to the shows. I have been alone on a farm and my time at the show season seems to be taken up with farm duties, but I want to say that I am still breeding White Plymouth Rocks, and have some good birds on hand at all times. I am planning on showing my birds this winter and trust I may win my share of ribbons.

There is one secret in the purebred poultry keeping, and that is treat your birds kindly, never frighten them, and give them plenty of exercise. They will do the rest.

Richard H. Dodes.

At the Last New York Show.

Speaking of disappointments, this makes us think of a remark made by William Moore of Canada to Mr. Sprague, manager of Lucknow Farm, just after he had lost first old pen. Mr. Sprague had won first old pen in the Buff Orpington class for three years. He turned to Mr. Moore and said: "That is certainly a great disappointment. It hurts." Mr. Moore said: "Yes, it is a mighty good thing it did hurt. If it didn't hurt, you would not try to do better and come back next year. It would not be worth while if it did not hurt." Certainly some good philosophy.—J. I. Lyle.

Start Them RIGHT and Watch THEM GROW

These are not cows in stanchions, but husky Leghorn chicks feeding from two 20-inch Norwich Chick feeders. This shows hygienic chick feeding to perfection.

Cleanliness is of Vital importance in raising chicks. Untold thousands are sacrificed every season through unsanitary conditions. There is nothing that will spread disease quicker than polluted feed. If chicks can get into their feed they will pollute it, and the result is always sickness and loss.

The Norwich Chick Feeder keeps feed in and chicks out. The detachable guard rod prevents chicks getting into the feed, and is too small for them to stand on. All they can do is line up, as shown in cut, put their heads under the rod and eat.

The round feeder body prevents all waste. The feed saved will pay for the feeder in a single season, to say nothing of the chicks saved as a result of feeding under hygienic conditions.

The Norwich Chick Feeder is not the 25c kind that lasts but one season. It is built to conform to the high standard of all Norwich appliances, and with reasonable care will last a life time, making it the cheapest feeder on the market. Use it alike for feed, milk or water.

BUFF WYANDOTTES.

By Mrs. ELY BROYLES.

The beautiful Buff Wyandotte has great possibilities which are sure to be realized in time to come.

In this variety we have the handsome White Wyandotte, with a plumage turned to gold and all the curves and fullness of type which are found only in the plump, rounded form of the Wyandotte.

With all this beauty and magnificence there remains the fact that the variety is being bred for great egg production; and as all Wyandottes are prolific layers owing to their deep bodies, medium size and great activity, there is no reason why the Buff should not make egg records in the future as they have in the past. The table quality of the Wyandotte as a broiler has always surpassed all other breeds, for it matures quickly into a plump, full breasted carcass that is easily cleaned because the chicks feather early.

The neat, close fitting rose comb is not frozen in winter to mar the beauty of the bird or stop egg production. A feature predominant in some strains of Buff Wyandottes, and bred in them from the time of their beginning, is a sort of non-setting quality which makes them easy to break from setting, if they become broody at all, and not needed for hatching. Their entire time may be devoted to egg production, instead of spending days and weeks in the broody coop being broken up. Since the general use of incubators the old habit of setting is no longer a virtue in the egg producing hen. If allowed to set and brood their chicks, Buff Wyandotte hens make the finest of mothers.

The variety is purely American, and was exhibited first at the Garden Show in 1894, by New England fanciers.

Their profitable maintenance comes not alone from either meat or egg production, but from both; so that if one is not enough, the other is to be relied upon to fulfill any shortcoming. You do not "put all your eggs in one basket" when devoting your time to raising Buff Wyandottes, as you have two chances for a good profit. This dual purpose quality should appeal to farmers of the great Middle West.

Another source of profit is filling orders for breeding stock, hatching eggs and baby chicks. Unlike the case in some of the older and better known breeds, the field is open and the demand is great. Any one who can and will produce dependable stock can enjoy this trade, and no other breeder in this variety has captured the best of the business, or has a monopoly on the trade, or is able to produce all the good birds. In fact, production of the Buffs has not kept up with the fast increasing demand, and purchasers inquire in every direction for available stock or eggs, and the demand is always much greater than the supply.

The greater shows have all had a great display of Buffs the past season, and the improvement of quality is very noticeable from the exhibits of a few years ago. Breeders in the Central West have now made a start, and Chicago had a notable display at the

Henry Michel & Son Box 11 Sublette, Illinois

last Coliseum show. Even my own state woke up, and entered a most creditable lot of Buffs at the last state poultry show, which has caused more inquiry from breeders in Missouri in the past few months than in several years past.

Annual meetings and displays have been held in the East, principally because breeders of this variety were located there, but fast growing interest in the South and West has offered the opportunity of bringing the next club meet and display further west, and Kansas City is most favorably spoken of for this meeting. The great army of beginners in Standard poultry will in that way have a chance to view some of the best specimens produced to date, and will find in them, I am sure, the possibilities they are looking for.

A Safe and Sane Buff Color.

The question which all breeders of Buff varieties have been up against is the interpretation of the Standard requirements of Buff color. This is a color hard to define in print, so that it may be understood by all alike and bring uniform results in the finished specimen. For this reason buff is interpreted as anything from pale lemon to dull orange. Plumage can be produced in any of these shades, and the different interpretations of what constitutes rich golden buff has been a stumbling block to a more general and uniform understanding of the exact color required and best to keep the variety popular.

The Buff Wyandotte Club has under way a pamphlet to further establish a uniformity of the proper shade of buff, and other questions of interest to the beginner. This will properly take into consideration the fact that Buffs grow lighter with age, and to secure a Buff hen a pullet must be bred with sufficient color to allow a lighter shade for the hen; and not become too light to maintain a good color through the breeding season and up to the next molt. It is a fact that the average person likes "color" in his flock.

The present requirement is for that level, even shade of color for all sections alike—back, breast and neck; without mealiness or shafting. The one time difficulty of black in tail and wing has been greatly lessened, and many birds come free from that defect, but do not misunderstand me and think that solid buff birds of either sex are so common as to be plentiful and low in price. Any bird that is of reasonably good color and type and free from black in plumage is yet considered a valued specimen, and is not easily picked up for a song.

When good color and type are found and size and vigor are sought, then difficulties are doubled; the birds of best color are often undersized, and when a wonderful type is produced desirable color may be lacking. But who would live in a world with nothing to strive for, and how flat life would be with nothing to do! Zest is added to the production of Buffs by the difficulties to be overcome. The other fellow has the same problems you have, and if you can surpass him you have earned the reward. And you will experience an urgent demand for

Ready for Prompt Shipment

These great colony brooders Oil-burning and coal-burning

Just now, with big hatches of chicks coming along, you must be sure of two things:—that the brooder you buy will do its work well and that the machine will reach you promptly.

If you know much about this chicken-raising business, you know that the Newtown is a mighty good brooder. So that point is settled. And we can and will make prompt shipment, do our level best to get your brooder to you quick because we know you need it. Last season we were unable to supply all the brooders our friends wanted. That hurt, both ways. So this year we got a big stock ready. Your machine is waiting for the address tag. Where shall we ship it?

Take your choice of type—either coal-burning or oil-burning. You will easily raise good chicks with either one. The coal-burner has been on the market for years. We admit it is the best of its type.

And we are just as sure that this comparatively new oil-burning brooder will lead in its field also. We knew for a long time that a lot of people wanted an oil-burning colony brooder, but it was quite a trick to make one good enough for the Newtown name. The big problem was to get the burner just right—but it is *right* now. No wick—steady blue flame—no smoke—no noise—but a great heater. And we overcame the common difficulty of uncertain fuel flow—due to thickening of oil in cold weather—by cutting out the tricky valves and regulating the oil supply by a thermostat under the hover. The temperature stays put where you want it.

To "raise the most chicks, the best chicks with least trouble and at lowest cost"—the NEWTOWN. Write for the catalog.

And here's good news for someone. We have, through unexpected good luck, two Newtown Giant Incubators that we can ship promptly. Better wire if you are interested.

all you can produce at profitable prices, for good Buffs will bring almost any price you ask.

In 1918, while at the Kansas City Show, I commissioned Judge Drevenstedt to secure for me an outstanding male with certain desirable points during the winter show season, to mate with my winning females at Kansas City. He commended my birds highly; and although I held the yard open until February, the male desired was not found, or was not for sale, although I was willing to pay an unusual price to secure him.

Single Mating Satisfactory.

Double mating has not been resorted to by many breeders, and I hope, for the best interests of the variety, will not be, although it may be a short cut to the desired end, as choice birds of both sexes can be produced from one mating.

The Buffs have the great advantage of requiring less preparation for the show room than many other varieties, and if of proper color are in exhibition clothes most of the year; but the light shades grow shabby and faded in appearance early in the season, and are not likely to keep the breeder's interest for long when they grow unattractive to the average visitor. But the apostles of over-conditioning will find a fertile field with the Buffs, and can create as much excitement as with any known color, for bleaches, blonde and brilliantine would no doubt stage birds in an attractive manner when in able hands.

The chicks are a beautiful golden color, nothing could be more attractive; the eggs a medium creamy shade, attractive on the market, and of good size; their hatching season is neither extremely early or late, but about what the average breeder likes to produce pullets for early laying; and no fowl dresses nicer or has a finer flavor. They are active and hardy, and will keep the interest of the entire family. They are equally at home in a small run or when on free range. They are the yellow-legged kind, and a golden opportunity to every lover of fine feathers on fine fowls that will also produce.

Getting a Good Hatch.

Run the machine for a week previous to putting the eggs in so that it will be well regulated and lessen the danger of spoiling the hatch.

The cause of poor hatches is a much discussed question, which depends on a great variety of circumstances. A poor hatch is more liable to be due to the condition of the eggs previous to setting than it is to incubation. When the eggs fail to hatch, see if the breeding stock is kept under conditions which tend to produce strong, fertile germs in the eggs; if the eggs have been handled properly before incubation; and if the conditions were right during incubation, as judged by the time of the hatch.

Of the various styles of coops used for setting hens there is no one that is outstanding. The nest should be carefully prepared, with three or four inches of damp earth in the bottom of the box. The nesting material is put in next, and may consist of hay, chaff or straw. Pack this material down firmly and shape a circular nest out of it, making it slightly deeper in the center than at the edges, as a nest so shaped will prevent the eggs from rolling out from under the hen and becoming chilled. Do not make the nest too deep, because it will cause the outer eggs to crush those in the center.

H. D. MUNKOE.

Save Chicks--Get Big Hatches

How to Avoid Chick Bowel Trouble and Death in Shell at Hatching Time.

The time is here when every poultry raiser must "know how" or fail. Every dead chick means a loss to the poultryman of 50 cents or more. The death of only a few chicks sometimes wipes out the entire year's profits. To prevent this loss it is absolutely necessary that you "know how."

How much better it is to avoid dead germs and dead chicks in the shell at hatching time and to then know how to raise your hatches without loss from bowel trouble and white diarrhea. A chick's weight doubles in seven days if it's properly brooded and fed. Chicks grow only as the poultryman furnishes material to grow on. The way most people feed chicks it's no wonder so many die and others remain scrawny, light-boned and sickly. The trouble is, so many are not well hatched to start with and then they are improperly brooded and don't get enough proper feed at the right time to grow on.

This was my experience for years and years until one day I read an advertisement where Prof. T. E. Quisenberry, Pres. of the American Poultry School, would send a Free book on poultry to all who wrote him. I mailed a post card that very day. Soon the book arrived. It put me on the right track. I no longer lose hatches and have never lost a chick from bowel trouble and white diarrhea since I secured the methods used by Prof. Quisenberry. It is a shame so many millions of eggs and chicks are lost each year because of wrong methods. I don't know if Prof. Quisenberry is still giving these books away, but if so, I wish every poultry friend had one.

New 100 Page Book Free

"New book just off the press and ready to mail at once free to any reader who writes for one," is the word sent out by Prof. Quisenberry regarding his latest new book.

Of importance to every poultry raiser is the chapter in this free book telling how to feed to get strong, hatchable eggs; how to prevent dead germs and dead chicks before hatching time! How to prevent baby chick bowel trouble, white diarrhea, etc., etc. These free books are certain to go like hot cakes. If you need this information don't delay, but write Prof. T. E. Quisenberry, Pres. American Poultry School, Desk 2066, Kansas City, Missouri.—Adv.

BREEDING AND EXHIBITING S. C. BLACK MINORCAS.

By R. O. LIPTON.

Aside from its unsurpassed qualities as a layer of large white shelled eggs produced under all climatic conditions, the Black Minorca is the fancier's breed for excellence. No breed in the Standard offers a greater reward to the breeder and exhibitor who can put down a string of males, females and pens in rare Standard form and color. On the other hand, no breed in the Standard will respond more quickly to intelligent handling by the egg farmer.

The Black Minorca hen not only lays well, but pays well, quality and size of eggs considered; even pullets producing marketable eggs of and above the established weight of 24 ounces to the dozen.

Breeding Black Minorcas for exhibition offers a broad field for the true fancier to cultivate, and the many thorough fanciers that have been identified with the breed in the past, and the large number of prominent breeders engaged in the breeding and exhibiting of Black Minorcas today, demonstrate the fascinating qualities of this fowl.

The magnificent exhibit of 204 speci-

S. C. Black Minorca hen with an egg record of 254, imported from England by Edgehill Farm. The big lobe is characteristic of the British Minorca.

mens at the Madison Square Garden of 1920, attest their great popularity.

Success in breeding Black Minorcas for exhibition can only be attained by starting right. By that we mean the males and females in the breeding pens must not only measure well up to the Standard in type, size, head points and color, but the breeder must line breed his stock; or in other words, keep complete records of the related dams and their sires and note the results in their progeny. His guide for selecting, breeding and exhibiting Black Minorcas, must be the Standard for shape and color described in the American Standard of Perfection. But it must be borne in mind that the latter describes the ideal specimen, one that is rarely, if ever, found in the show room or breeders' yards, albeit many specimens will reach a very high ideal in form and color. The novice should especially bear this in mind when purchasing stock for breeding or eggs for hatching. A perfect bird is purely imaginary, for even the best bird ever bred or exhibited is sure to possess some minor fault.

Shape is of utmost importance in the selection of the breeding stock, notably in dams or hens. Many a hen of grand

EGGS

Our winnings were made in competition with one of the strongest classes ever exhibited. At Boston, 1921, we won 1st old pen and 1st young pen.

Eggs and Chicks from our prize pens at Madison Square Garden and Boston poultry shows. If producing an abundance of large, white eggs is your primary object, start with Paige's Minorcas, the acknowledged prolific layers, delicious table fowls and dependable prize-winners.

Our specialty: Prepotent cockerels that will improve any flock. Write and state your requirements.

F. E. PAIGE, 715 West Avenue, Medina, N. Y.

form and constitution has laid the foundation for a line of superior pullets in type, size and color.

In-and-in breeding intelligently pursued will result in establishing a line-bred strain that reproduces itself in form and color of both males and females. In other words it fixes the outstanding good points of the sires and dams. On the other hand careless in-and-in breeding will quite frequently fix or accentuate the faults of the male and female.

Size is a necessary and a desirable asset in both breeding and exhibition specimens; but over-size in body, bone and comb is a serious handicap to the breed. English fanciers have been responsible largely for the heavy-boned Minorcas, with ponderous bodies and beefy combs. This may be due to the inborn belief still cherished by English livestock breeders that plenty of "beef and bone" are indicative of strength and vigor in all the domesticated races of animals. This belief has been shared

A cockerel breeding S. C. Black Minorca female that has produced many blue ribbon winners. Females of this type produce male progeny that have combs with large, firm base, that never lop. Photo by courtesy of R. O. Lipton.

by livestock breeders of other countries, but not in such a broad and sweeping application as in England. Too much "beef and bone" in a chicken tends to coarseness and the Black Minorca is not a coarse bird, but a large, vigorous, active fowl. Bred to the American ideal in head gear, no guards for the combs will be required to hold them up, as has been the case with the combs on English Black Minorca males.

Mating for color is one of the most difficult problems for the breeder to solve. Experience has demonstrated that good colored birds on both sides do not produce a high percentage of good colored birds; but that females with black plumage right through, no rusty fluff, mated to a male as green as possible, if red in the neck hackle so much the better, produce the highest percentage of good colored birds. Yet, there are breeders who seem to look upon a red feather in the neck of a bird as a most damnable defect, when in reality it is a most valuable color breeding asset.

The same rule will operate with the breeding hens. It is not always what the breeding dam or sire appear to be in color but what they produce in the progeny that counts. A pen of birds almost perfect in color, with hardly a trace of purple, resulted in producing birds grand in color of neck, back, saddle and wing bows, but breast and tail quite bronzy.

The American Breeds of Poultry

By FRANK L. PLATT

This new book, published 1921. Up-to-date in all particulars. 256 pages. 100 illustrations. Printed on enameled paper. Bound in brown cloth. The most elaborate and costly book we have ever published.

This is the only exclusive work ever offered to the public on the great dual-purpose breeds that have been made in America by the genius of American breeders. An entirely new text, in which the author goes back to original sources, and starting at the beginning writes a history of the American breeds, tells of their origin and traces each step in their development. Every detail on the proper mating of each variety is given in a plain, practical way.

All you want to know about Barred Plymouth Rocks, White Plymouth Rocks, Buff Plymouth Rocks, Partridge Plymouth Rocks, Silver Penciled Plymouth Rocks, Columbian Plymouth Rocks, Blue Plymouth Rocks, Black Javas, Mottled Javas, Black Giants, Buckeyes, Missouri Fluffs, Silver Wyandottes, Golden Wyandottes, White Wyandottes, Buff Wyandottes, Black Wyandottes, Partridge Wyandottes, Silver Penciled Wyandottes, Columbian Wyandottes, S. C. Rhode Island Reds, R. C. Rhode Island Reds, Rhode Island Whites, Dominiques. Full details on breeding for meat and eggs as well as all Standard points.

Only a few of the general subjects are:

Special breeding for meat type; What buyers of market poultry prefer; Inheritance of egg production; Effect of heavy laying on breeding power; Qualifications of a breeder; Work of the breeder; Building a strain; Inbreeding; Linebreeding; Variation; Prepotency; Judging the shape of a bird; Body shape of good layers; How to cull the flock; Value of the plumage; Color and structure of plumage; Breeding color and markings; Double mating; Growth of plumage; Molting.

No matter what breed of chicks you raise, whether English, Mediterranean, or American, you will learn much to your advantage.

Price, Postpaid, \$2.00

AMERICAN POULTRY JOURNAL
523 Plymouth Court Chicago, Illinois

It must also be remembered that the chicks that come with the brownish tinge are the ones most likely to develop into greenish-black beauties when feathered out.

The Black Langshan, which breeds remarkably true to color, come from chicks that were a greater part canary in color with very little black on the head and back, and with beaks and legs of flesh color.

Breeding Seasons.

When to set hens or start incubators with eggs in order to hatch strong and vigorous chicks, depends largely on the condition of the laying stock and the vigor of the male, and not on the season. Fertile eggs that will hatch strong livable chicks can be obtained in winter just as well as in the spring, notwithstanding some old theories that have been worn seedy, and which confined the hatching period to a comparatively short period in the spring of the year.

It is all very well to talk and write about the natural breeding season, nature's way, etc., and no doubt fowls in the wild state will not hatch and rear young in cold weather, but it is simply because they do not lay any eggs to do the job with. Modern fowls are the result of domestication, and the science or art of man together with suitable foods and environments, enable fowls to lay eggs at all seasons, barring the molting period. A healthy fowl lays a healthy egg. A healthy vigorous male will fertilize that egg in one month as well as in another.

Breeding from immature or undersized females and males, over feeding with grain and condition powders, lack of exercise, superannuated hens and cocks, are the factors primarily responsible for poor hatches in the winter time, and for that matter in the spring and summer also.

As to the plumage and size of early hatched chickens being inferior to those hatched later in the season, as some writers claim, we have failed to discover any difference in their appearance. But the care of early chicks necessitates much work and demands proper quarters, so that for convenience sake, May is preferable to March for hatching chickens in the colder sections of this country.

The Black Minorca is the breed that is adapted to all climates, for it thrives equally well in sunny California and in the Canadian Northwest. The hens will lay well, the eggs will hatch well and the chickens will grow well in every section of the United States and Canada in and out of season, when properly handled and fed. In the northern and eastern states, as well as in Canada, early hatched Minorcas are a necessity, if the cockerels and pullets are to be fit and ready to compete in the show room in the early fall and winter with those raised in milder climates.

Minorcas require a little longer season to develop into exhibition cockerels and pullets of surpassing form and quality, so that the proverbial early bird is the one most likely to catch the worm in the shape of the blue ribbon, all other things being equal.

Oil for Incubators.

The use of high grade oil is very essential to good results. A new wick is a good investment for each hatch, thus eliminating any danger of the wick giving out.

Mason's Movable Poultry Yards

\$16.85 and up

THE securest, most durable and attractive fence you can buy for your poultry. All steel and sanitary—comes to you complete with close woven fence, gates, posts and fittings, everything ready to put in place when received—You can build it yourself; no expensive help or special tools required.

Easy to Erect -- No Holes to Dig
Posts easily driven in any ground. Yard may be quickly moved to new, fresh location as often as desired or taken with you should you move.

Investigate now before you attempt to build your poultry yard in the old-fashioned, expensive way—Mason's Movable Poultry yards are made complete in our factory, all parts match, fit and harmonize—this saves all the usual worry in building—gives you a 100% better fence. Prices \$16.85 and up.

Mason Poultry Fence Co.
Box 46 Leesburg, Ohio

WHITE DIARRHEA

A PERFECT HATCH! THEN WHAT?

Will you save every chick, or shall WHITE DIARRHEA get them? This contagious germ disease causes greater loss than all other poultry diseases combined. In infected flocks the loss varies from 50 to 80 per cent of the chicks hatched. Chicks that

recover often remain stunted all their lives.

Stop this enormous loss. Raise every chick you hatch. No need to lose a single one. Raise them all. Keep them healthy and strong and growing fast.

"Giles" POULTRY-TONE

is a safe and effective germicide for all bowel germ diseases. It combats the germs that cause white diarrhea and it tones up the system so the chicks can resist disease.

"Giles" POULTRY-TONE positively prevents White Diarrhea. For Chicks already affected it affords prompt and permanent relief.

Send 20c for trial bottle. Enough to treat 12 chicks. Enough to prove its great efficiency. Larger bottle 50c; quart can, equals ten 50c bottles—\$2.50. Prepaid. Satisfaction guaranteed or money refunded. The season is here. Be prepared. Act now. Order today.

HINTS TO BEGINNERS ON FEEDING FOR EGGS.

Eggs have, as a matter of fact, sold for more this season than at any time in my experience as a poultryman. But what good are high prices if you are not able to benefit by them? If you have no produce to put on the market you cannot participate in the profits. If you have a fairly good size flock, and they eat up a pile of feed, yet loaf on the job, you are not going to profit, no matter how high selling prices are.

Have you stopped to wonder what was the matter? Perhaps you have consulted your neighbors, but only in vain.

I have been in the poultry yard studying fowls for a good many years. I should have learned a few things about egg production in this time; and egg production has been the chief aim of my efforts. Therefore, let me give in a brief sketch my method of securing profitable egg production.

I have been a close reader of the Journal for a long time, and have, at various times, taken from the Journal many of its recommendations. With these and the various facts I have picked up during the past decade, I have produced records that make my fowls stand out as little short of wonderful.

I have discovered one of the vital essentials of high production lies in the proper balancing of rations fed to the flock.

There seems to be a popular notion among average farmers that rations of grain, such as wheat, corn and rye, are all that are necessary for the production of eggs. The fact is that such feed, not substituted with mash, seldom results in eggs during the winter months, and usually not until spring.

A ration containing coarsely ground corn and wheat and commercial meat scrap should prove equal to the task of whipping a bunch of hens into laying condition. Such a ration might be satisfactorily compounded by mixing to each one hundred pounds of coarsely ground corn and wheat (half and half) fifteen pounds of meat scrap. This mixture is fed by the writer, in a moistened state, to prevent the nutritious particles from wasting.

During the war the cost of ground feed was so high that it was out of the reach of the many poultry keepers to supply the necessary parts and at the same time realize a substantial profit.

This year the prices of corn and wheat are far less than last year. Therefore, it is not so difficult to supply the needed material necessary for normal production.

Oats and a part of buckwheat and a similar ration of rye or barley, offer an excellent scratch feed. It is a good policy to use a part of both scratch and mash, giving a fairly good feed of the scratch mixture early in the morning, thrown into about six inches of clean litter. This not only supplies the necessary grain for good production, but it offers the necessary exercise to promote the health and physical vigor; both of which are necessary if the feed consumed is to be turned into profit.

The mash compound produces good results when fed at noon. If milk is available it can be substituted for a portion of the meat scrap. In fact, I know nothing better than milk as both a big egg producer and a promoter of good health and vigor.

If your flock is on free range they will pick up a great deal of green food commonly called green stuff, but if they are penned up and must depend upon supplying it, you should at least give a good feed twice a week.

Virginia. Clayton G. Gates.

Give the Javas a Show.

Interest is now being shown by farmers and fanciers in the old-fashioned Black Javass which were twenty years ago very popular, and common in many localities, especially on the farm.

Their large size, extremely yellow flesh and heavy laying qualities made them in years past very popular. They are now becoming more popular, being better bred and possessing heavier laying qualities. Being a very hardy fowl they are a wonderful all-round breed.

In social life we may hear of a new dance which becomes very popular, and for a while becomes the rage, but still the old-fashioned waltz and two-step sticks with us, and from time to time they are wholly revived.

The old-fashioned Java was used in the origin of some of the modern breeds. Some of these newer breeds have become popular, but the foundation stock is coming back with increased popularity. The Black Java was used in the origin of the Barred Plymouth Rock. This grand old breed, the Black Java, has never been completely forgotten and a few able men have bred and preserved it until now and today the old breeders will tell you that the Black Javass are better than ever before.

Now is the chance. Give them a welcome. They deserve it. Without them we would not have had some of the popular breeds of today, whose good qualities came from the Java. The Javass still have them and then some, so let's give them a try.

Maine. Robie Whitney.

Temperature During Incubation.

The correct temperature depends upon the position of the thermometer in the egg chamber. It is best to follow the directions sent out by the manufacturers of the incubator in setting up and operating the machine. At hatching time the machine will frequently run up to 105 or 106 degrees without any injury to the chickens. In a good hatch the eggs will start to pip on the nineteenth day, and most of the chicks will be out before the twenty-first day. If the hatch is much earlier or if it runs over 21 days, it indicates that the conditions during incubation have not been right. A high temperature will hatch eggs too quickly and produce weak chickens, while a continuous low temperature throughout incubation will delay hatching for several hours and produce very poor chickens.

When the Egg Shells Are Pipped.

I saw in your paper recently that some people claimed that the eggs which pipped at the small end hatched out roosters. I do not say it is not true, but I have been raising chickens for more than twenty years (ever since I was ten years old), and it has not proven so in my case. I seldom have an egg to pip on the small end, and when such does happen I nearly always have to help the chicken if it gets out of the shell. In spite of the few chickens that have pipped the smaller end of the egg I have always had a plentiful supply of cockerels.

The CYCLE HATCHER and

Better Hatches of Strong Sturdy Chicks

You can hatch more and better chicks with the new easy Cycle way of hatching.

The Cycle all-metal Hatchers are the perfected result of more than thirty years' study and experiment in poultry keeping and artificial methods of incubating.

The success of the Cycle method is due to closely following the principles of natural incubation, insuring large, strong, normally developed chicks that are no trouble to raise.

Hatching with hens is uncertain. The low-cost Cycle will solve your hatching problem. No waiting for setting hens, which frequently desert their nests, or are forced away by lice, no breakage of valuable eggs, no lice on the chicks when hatched.

It is necessary to use an incubator to make the best profit from even a small flock. The fifty egg Cycle is just the right size for most poultry keepers. No long delay is necessary to get eggs enough to fill the machine. Start the Cycle with any number of eggs up to fifty. Fresh eggs always hatch better and the chicks are stronger.

The Cycle hatches hen's, duck's, geese and turkey eggs equally well.

SPECIAL FEATURES THAT ARE VITAL FOR BEST RESULTS

1st. The heated air is applied on top of the eggs only, as under the hen.

2nd. No direct air passes through the hatcher to carry off the natural moisture of the eggs.

3rd. Being circular, with the lamp in the center, the radiation is equal throughout the machine.

4th. The heat is brought close to the eggs, with no waste of heated air space.

5th. The eggs are turned and cooled similar to nature's way.

Study the hen, and investigate the Cycle. It will pay you!

Low Cost of Operation

A few cents for oil will pay the operating expense for a full hatch.

It costs fully three times as much to feed three setting hens to hatch fifty eggs as it does to operate a Cycle.

You can hatch baby chicks from your best hens at a cost of six to ten cents each, including the value of the eggs. With the Cycle you can hatch a good sized flock to raise and some to sell.

Easy to Operate

Hatching with the Cycle is easy to understand. The beginner can get good hatches as well as the expert. There are no complicated parts or difficult adjustments to be made. Anyone who can properly care for a lamp can operate the Cycle successfully.

It is no more work to care for a Cycle Hatcher, hatching fifty eggs than to care for one setting hen.

The Long Burning Safety Lamp is a safe, dependable kerosene lamp. The oil in the large flat tank never becomes heated. Requires filling only once or twice during the hatch.

The heat is governed by an automatic regulator that maintains an even temperature in the egg chamber.

The Cycle way of hatching is both inexpensive and dependable.

The \$9 Cycle Hatcher

A Practical, Dependable All Metal Hatching Machine.

Durable, Practical Construction

The Cycle is built to last. It is made from best quality strong material that will give satisfactory service year after year. Read the letters on this page from users who have operated their Cycle for eight or ten years or more.

The Cycle is light in weight, but strong. Can be easily moved from one location to another—even while filled with eggs. Operates successfully in almost any location.

The Cycle is sold at a low price because we build thousands of them. Most parts are made in huge presses that stamp the parts with absolute accuracy. A high-priced machine does not always indicate the best hatcher. We guarantee that the Cycle will hatch as large a percentage as any machine made.

The price includes complete equipment—lamp, automatic regulator, tested incubator thermometer, and direction book.

The \$11 Brooder-Hatcher

A Combined Hatcher & Brooder. One Lamp Serves Both Purposes.

Immediate Shipment No Delay!

We carry thousands of Hatchers in stock. All ready to attach a label with your name and address. Early chicks fill the winter egg basket and win at the shows. Order your machine now!

Successful Users Tell of Big Hatches

NOTHING BETTER IN INCUBATORS.

R. F. D. 1, Rockville, Conn., Jan. 15, 1921.

Gentlemen:

I have two Brooder-Hatchers and have run them for ten years. I have hatched 48 chicks from fifty eggs. There is nothing better in incubators. I am enclosing check for two more.

Alfred E. Rich.

CYCLE CHICKS EASY TO RAISE.

Sharon, Tenn., Jan. 3, 1921.

Gentlemen:

I have been using one of your Cycle Hatchers for five or six years; like it fine and raise nearly all the chicks hatched in them.

Respectfully,

Mrs. Jennie Underwood.

FINDS THE CYCLE MOST DEPENDABLE SMALL MACHINE MADE.

February 1, 1921.

Gentlemen:

I have used one of your Hatchers since 1912 and have found it to be the most dependable small machine made. It is greatly superior to anything short of a mammoth machine. My pullets hatched in the Cycle habitually commence laying at 5 months of age.

Very sincerely,

Chelsa C. Shulock.

CYCLE BEST MACHINE FOR DUCK'S EGGS.

Jan. 13, 1921, Two Harbors, Minn.

Gentlemen:

We use the Cycle Hatcher for ducks' eggs and it does great work. Beats anything we have ever tried except hens, and it does not break the eggs as the hens do sometimes.

G. McCoy.

The PROFITABLE

the PHILO SYSTEM PLAN

Philo System Poultry Supplies and Appliances will help to increase your profit, reduce expense and save labor. Complete line at moderate prices includes Philo System Ready-Built Coops, Fireless Hovers, Brooder Coops, Dry Mash Hoppers, Feed and Water Dishes, Caponizing Sets, Leg Bands, Egg Cartons, Shipping Boxes and Baskets, etc. Write for free copy and also a free copy of our new book, "The Profitable Home Poultry Plant" that gives many ideas and suggestions you can profitably use. Free! Send a postal today.

The Suburban Coop

A Laying or Breeding Coop for 10 or 12 Hens.

New Style Ready Built Coop for Winter and Summer Use; 10 or 12 Hen Size. Price \$30.

A complete poultry house for a ten or twelve hen flock, size 6x6 feet, built in sections that can be set up in a few minutes time, winter or summer. A large stock is kept ready for immediate shipment. Save time and money by ordering one of these coops.

They are designed to provide the best conditions for the flock and will increase the egg production. They are arranged to give practically open air conditions for summer and pleasant winter days, yet can be instantly adjusted to provide protection in the most severe weather.

Just the right size for a pen of breeding fowls to produce fertile, hatchable eggs. Also ideal for use as colony houses for the growing chicks. Large enough for 20 to 30 half grown chicks. If a yard or park is used the capacity is easily doubled.

Small plants find these coops especially suited for all purposes.

Large plants find a few of these houses practical and convenient for special purposes—housing surplus cockerels, for capons, for special pens, etc.

Easy to care for and easy to clean. Built in sections from selected lumber and lined with heavy asphalt building paper, and painted.

Price \$30 each, complete with feed and water dishes, roosts, etc.

The Economy Coop

A practical, well made low cost house for a flock of six hens. This is the style house used in making the wonderful records that resulted in the widespread popularity of the Philo System methods.

These coops are three by six feet in size, suitable for both winter and summer use and are shipped complete with feed and water, dishes, roosts, etc. They are painted inside and out, are durable, and make an ideal laying house for growing chicks, etc.

Price complete, \$18.50.

Shipping weight, 200 lbs.

Colony Brooder Coop with Fireless Hover

This is a complete out-door brooding outfit for any number of chicks up to fifty. You can save time and expense and reduce your losses of baby chicks by using this brooder coop and hover.

This coop provides clean, dry and sunny quarters where the chicks can be kept comfortable at all times, and with complete protection against rats, cats, hawks and other chick enemies.

The glass roof section makes the interior light and sunny and the solid roof section is hinged to make the care and feeding convenient for the poultry keeper.

Well made, painted, and can be set up ready for use in a few minutes time. We carry a large stock ready for immediate shipment.

Price, complete, \$13.50.

Extension yard or park for use with above coop, \$3.00.

50 Chick Fireless Hover \$2

This new simple and inexpensive brooder will help you raise a fine flock of chicks with very little loss. They are easy to use, keep the chicks perfectly comfortable and there is no expense for operation. They are designed to retain the body heat of the chicks and yet provide good ventilation.

Price \$2.00 each. Shipping weight 7 lbs.

SEND A POSTAL TODAY FOR COMPLETE FREE CATALOGUE.

PHILO BUSINESS-HEN White Orpingtons

The great breed for profit. One of the finest breeds for the home poultry plant. They are large, often the cocks will weigh 10 to 12 pounds, and their flesh is of unsurpassed quality for table purposes. They are remarkable winter layers, and mature quickly for so large a breed.

We have bred the White Orpingtons continuously since their introduction in the U. S. and have a fine lot of breeding pens from which we can supply hatching eggs and baby chicks.

Try our White Orpingtons if you want size, quality, and heavy egg production.

Class A—Exhibition Stock Matings: Eggs—\$10 per 15; \$30 for 50 eggs. Baby Chicks—\$1 each in lots of 12, 20 or 25.

Class B—Heavy Egg Producing Matings: Eggs—\$5 per 15; \$14 per 50; \$25 per 100. Baby Chicks—\$7 for 12; \$12 for 25; \$22 for 50; \$42 per 100.

PHILO BUSINESS-HEN White Leghorns

Our stock of this greatest of all egg-laying breeds, has been carefully selected by all the tests for determining the high producing hens. The breeding pens from which we supply eggs and day-old chicks represent the choicest birds selected from a large flock. Our strain of Leghorns will please you. They are good size, good Standard type, selected heavy producers of large chalk-white eggs.

Prices: Eggs—\$2.50 per 15; \$6 for 50; \$10 for 100; \$27 for 300; \$80 for 1,000. Baby Chicks—\$4 for 12 chicks; \$8 for 25; \$15 for 50; \$28 per 100.

Other Varieties of Baby Chicks

S. C. Buff Leghorns, S. C. Brown Leghorns, Barred Rocks, White Rocks, Buff Rocks, Rhode Island Reds, White Wyandottes, Silver Laced Wyandottes, Black Minorcas, Mottled Anconas, S. C. Prices \$28 to \$34 per 100.

JOHN L. BROWN,**65 Indiana Ave.,****ANDERSON, INDIANA****AN EXPERIENCE WITH BARRED PLYMOUTH ROCKS.**

By E. C. PENDLETON.

Nine years ago a neighbor's hen which was once upon a time a Barred Plymouth Rock, stole her nest under my back porch, and in due course of time brought out twelve sturdy chicks. I raised the chicks, every one of them, and this good success gave me the chicken fever.

As a boy I had been very fond of pigeons and I had had a great deal of experience with them. I had raised them by the hundreds and I thought I might be successful with poultry. I commenced planning my poultry house. I built it air-tight, with a glass front, lined it with felt paper and covered it with rubber roofing. Some hot house, and I had my troubles. I have since built five houses, and am commencing to find out what I require for the comfort of my birds.

A neighbor, R. J. McCray, whom many of the old-timers will remember as a very successful breeder of Barred Rocks, fifteen or sixteen years ago, suggested to me that if I were going to raise Barred Plymouth Rocks I should raise real ones.

It seemed to me when I was sending my first order that \$10 was a lot to pay for a setting of eggs and I surely should get many first prize winners, but I did not. However, I kept every chick from those eggs as long as they lived. I have had eggs since and I have used every bird I considered prospective; and by the selection of my best individuals, mating them to the best of my ability, and with the assistance of one of the top-notchers in the Barred Rock business, I have developed. I have stuck to the one strain absolutely, a strain of birds that are attracting attention today in the middle west. It takes some years of hard work to develop from a foundation, a strain of Barred Rocks that will demand respect.

I have had all the varied experiences of the would-be fancier. However, lice are my pet peeves. I have fought them singly and in hordes, individually and collectively, and the sooner that the poultry fraternity comes to the realization of the fact that lice are to blame for almost every malady existing among our fowls the sooner success will be written over every hen house door.

In thinking over the past and my successes and failures I wonder why every one getting into, or trying to raise, poultry does not enroll at once in a school of poultry husbandry? I am saying this without the slightest personal interest in any school or from a mercenary or financial point of view. I am in no way interested except as a student of a school that has been a good thing for me. I know that had I gotten in earlier I would have been saved many a hard jolt, and would have been time and money ahead. Some may say that they take this, that or the other poultry magazine; well, so do I; but you need a text and other sources of information besides your magazines. Get all you can from the other fellow, and profit by his or her experiences.

Breed Normal, Healthy Specimens.

Barred Plymouth Rocks are sometimes criticised on account of slow development, twisted wings, etc. I am coming to the belief more and more every day, as I hunt up my pedigree

"HI-YIELD" Stove Brooder

Here Is a Real One

Burns but a few cents worth of hard or soft coal per day. Fill once, shake twice—that's all. Thermostat regulates the temperature, set it where you want it, and forget that part of it. Use it in any room, no matter what the temperature. Wide galvanized canopy spreads the heat widely and evenly over the backs of the chicks. No crowding, plenty of room for exercise with real ventilation. Adjust canopy to any height you want it, through cord and pulley fastened to ceiling. Rocker furnace grate and shape of stove prevent clogging of ashes and coal. This item is only one of the big line of HI-YIELD Poultry Equipment. Send for illustrated catalog.

F. C. WILBERT & CO., Grand Rapids, Mich.

records and examine birds of certain families, that bad wings, slow development and feathering come primarily from lice. The hen is lousy, or it may be the chick gets a bad start as a result of poor feed, but I do not believe in slow-feathering chicks, or twisted wings being hereditary. However, I am afraid of what I call a split-wing. That is a wing that is not firm; when you take hold to spread it you find it weak or double-jointed. I avoid breeding a split-winged bird.

How have I arrived at this conclusion. First, every male and female in my yards has a number. Every egg that is laid is trapped. When chicks are hatched from a setting of eggs from hen No. 1, these chicks are all numbered with pigeon-number bands, and the numbers recorded in my pedigree book. Records of all matings are kept from year to year. If a chick is lousy and gets off feed, even for a few days, a notation is made in my records. If a chick is not especially strong when hatched a record is made. If a chick gets a leg broken, comb torn, eye put out, or whatever happens to it, I make a record of what I find.

I was handling a very worthy cockerel the other day that had a record of a broken leg last July. Not every one would notice it today. With my records and other things being equal, I would not hesitate to use this bird as a breeder where otherwise I would be afraid of him. I have followed these slow-feathering birds and twisted wings in the same way until I have arrived at the above conclusion.

If you breed from normal, healthy specimens that are vigorous, if the chicks go right off from the first day, you will have very few regrets. As I said before, I give lice the credit for almost everything. A bird young or old cannot be pestered to death and be happy and healthy.

I have also noted that if I have ten or fifteen chicks with a hen and there are any lice about, they usually all prey on one chick, or at least you will note one chick that succumbs most rapidly. It will commence to show signs of bowel trouble. Get rid of the lice and in many cases its bowel trouble will cease.

Picking the Males and Females.

In mating my yards the first thing I consider is type, good head points, firm wings and even colored birds. I want my flock to be uniform in color with good heads, and I want them to look like Barred Rocks. I want my cockerels to be large, masculine, with good conformation.

I want my females to be of the same even color but I do not want the big, heavy, meat fowl. I want topky, medium sized females that will not grow overfat when they have enough to eat instead of laying eggs. I want eggs from my Barred Rocks, and it is the medium sized hen that has the pep. These medium sized females, when properly mated, will produce just as big, fine cockerels as the great big meaty hen; and they will lay three times as many eggs in the course of a year.

Bars on a Barred Rock are the main factor in some minds, but bars without type are not Barred Rocks. A good typed, even colored bird will please more people than a very narrow barred bird without type. Therefore let us get the

MANKATO INCUBATORS

FACTORY

(Nature's Product)

SPECIAL REDUCED PRE-WAR PRICE.

Natural disinfectant and louse killer. Kills nits as well as lice. Sure death to chicken lice and hog lice. Kills fleas, ticks, and all other insects that infest poultry and hogs. Sure cure for scaly hogs. Cures scurvy and mange in hogs. Can be used in any hog oller. Recommended by U. S. Dept. of Agriculture. Chickens and hogs covered with lice can't do well. That way they are working for the lice. If you put Trenton Rock Crude Oil on them, both your chickens and your hogs will begin working for you instead of the lice. Special reduced pre-war prices—five gallon cans, \$3.00; ten gallon cans, \$5.00. Write for circular and prices on barrel lots. Now is the time. Write us today. Mention this paper.

Keeps Detailed Records.

Every day I receive a communication from some one who wants to know what strain I breed. Do they develop quickly? Are the females good egg producers? Do they have good wings, etc.?

By breeding from pedigreed stock, I retain all I have labored hard to achieve. By selecting my most perfect specimens I improve my quality. If I improve one section in a mating each year and retain what I already have accomplished, I have made some advancement and lost nothing. I have tried always to build slowly and well.

I had the pleasure this winter of submitting my system to one of the largest breeders of Barred Rocks in America. He had heard of the work I have been doing. I believe he saw where I have been accomplishing some good for Barred Rocks.

At the last Illinois State Show a breeder showed me a wonderful cockerel. I asked him about the dam and sire. His answer was that he had the sire but did not know the dam. I asked, "Don't you pedigree your stuff?" His answer was: "No, I don't have time." Then I said: "How are you going to improve this fellow next year, or get more like him if you want them? If you have time to raise Barred Rocks you have time to pedigree your stock."

There is no fowl existing that is more worthy of the admiration of America and the world than the Barred Plymouth Rock; there is not one breed that has greater possibilities as market fowls, show birds and egg producers.

It is my belief that the trouble with the average breeder lies in the fact that there are too few pedigreed flocks.

There is not one investment on the farm that from a business standpoint is more profitable than a flock of Barred Plymouth Rocks; investment, time, labor and cost of production considered in relation to the returns derived.

Barred Rock cockerels from purebred pedigreed stock will develop at the rate of a pound or better a month.

Barred Plymouth Rock pullets from trapnested, pedigreed strains will yield eggs when five and one-half and six months old.

Barred Plymouth Rocks on the market demand the very top price, due to uniform quality and size.

In the show room the Barred Rock classes are frequently the largest in the show. This one fact alone proves their quality. Unpopular varieties have small classes in show rooms. But, as Barred Rock breeders we should not imagine that because our variety is the most popular variety of fowl in the world, we can sit tight. The world is moving, and if you don't "hop on," the world will go on without you.

One of the most important and progressive things in this day and age is a detailed record of matings, trapnesting and pedigreeing.

It seems to be the idea of many that fancy qualities and eggs do not go together in Barred Rocks. If the two can be combined in other varieties, why not in Barred Plymouth Rocks? They can and are, and soon the strictly bred-to-lay man will be hunting another home. It is a fine ambition to do one thing well and the bred-to-lay Barred Rocks are a step towards success. How-

ever, to do two things well is a bigger thing and I am sure that the combined Standard and utility breeder will be doing more for Barred Plymouth Rocks than the bred-to-lay breeder has ever accomplished.

Every business demands system. Put system into your breeding of Barred Plymouth Rocks. No business or profession will yield a greater amount of pleasure and profit than the amount of energy you put into it. Your success will depend upon just how much kick you put into your work, how far into the future your visions extend and just how much of a dreamer you are. I have the mental picture of the Barred Plymouth Rock male I expect to produce 20 years from now. My ideals may change somewhat but without the vision I could never hope for success.

Keeping Poultry Accounts.

A record of the expenses and profits of the farm poultry flock can be kept without an undue amount of time and trouble, if the work is definitely planned the beginning of the year. Probably an account of the amount of feed consumed is the most troublesome to obtain. The easier way to handle this is to have two boxes or bins of known capacity, large enough to hold about the amount of grain and mash that the flock will consume per month. Whenever these boxes are filled, charge the amount of grain to the feed account.

In order to avoid complications in figuring the average number of hens on the farm for each month, the number on hand at the first of the month is taken as the average number for the month. For this reason when hens are to be sold, they should be disposed of as nearly as possible during the last week of the month, so that the flock average will not be seriously disturbed.

Females for Breeding.

Having trapnested the pullets, one will know positively what they are capable of doing as egg producers, and we can mate them the following season with the assurance that the egg laying ability will be transmitted to the progeny. The hens will have had a complete rest during the molting period and will have fully recuperated their vigor. They will be in the best possible condition to produce vigorous chicks. Their eggs will be of good size and will give us a large chick to begin with, and that counts for a great deal in the ultimate outcome. The female breeders should not be forced for egg production by the giving of red pepper and various stimulants. It is not how many eggs the breeders produce but how full of vitality they are. Free range for the breeding birds when the weather is mild is productive of good results.

Do Not Skimp the Feed.

Regardless of cost it will be profitable for you to feed your chicks throughout the summer. If hatched in May or later they will mature earlier if fed on meat scraps, tankage or milk along with mill feeds throughout August and September. Keep chicks growing and never starve them, for fall eggs are desirable and profitable.

Sell all slow growing, under-sized males or females now, as broilers. The price will drop faster than will be their gain in weight. Don't plan to breed from slow growing cockerels and late maturing pullets are poor breeders.

EGG LAYING CONTEST WINNERS

Winners of the National Nebraska Egg Laying Contest with a 210 pen average. Held under real farm conditions, 200 birds in a flock. High record hen 268 eggs. Four of the ten highest birds in our pen, 268, 251, 228, 226 eggs. Winners at Greater Cincinnati Music Hall Show in Heavy Laying Class, while our pens in the 1921 Egg Laying Contests are up with the best farms in America. Book orders now.

FORTY YEARS WITH WHITE WYANDOTTES.

By ARTHUR G. DUSTON.

When it was suggested to me that I write a little White Wyandotte history for the American Poultry Journal and I consented, I thought afterwards of a remark a friend of mine made one time. He told of a certain editor associating with him an old editor, and then said: "It looks like robbing the graveyard." I want to assure my readers that while I am an "old one" as regards breeding birds, I am far from an "old one" in feelings, actions and thoughts.

It is likely that some few of the newer breeders do not know Duston, so quickly are we forgotten, yet it has been only four years since I won heavily on White Wyandottes at Madison Square Garden, winning, among other prizes, first cockerel, which Judge Dakin pronounced the best cockerel shown since my former first cockerel at the Garden which was so well known as "Framingham Chief."

During these years I have kept in touch with the poultry world, done some judging, and handled several flocks of birds of different varieties, besides the flock at Sabrina Farm; and never for a moment did I lose my love for the handsomest and best breed on earth, the White Wyandottes. Hence my excuse for writing of them.

I wonder how many of my readers remember back to 1892 and recall the Wyandottes as bred at this time? Those light forms, rather thin, high tails, and birds that, almost without exception, had combs which inclined to the Hamburg type; and brass! My dear man, the White Orpington of today is an angel pure as snow compared with the brassy White Wyandottes that we had then.

I remember going over to Waltham, Mass., to see C. F. A. Smith, who had bred White Wyandottes for years, and finding his best cockerel stuck up in the loft, away from sun and rain, so that he wou! not brass and would be white for the New York Show. But, lay! those White Wyandottes sure did lay; and when it came to the market they were the same wonderful fowl as today.

I think back in 1894 I was the first one, up to that time, who had actually made two-pound broilers in eight weeks, and the whole matter was written up at that time. I had been able to grow these two-pound broilers only with the White Wyandottes. It was that that made the early reputation of the Wyandotte as a wonderful broiler breed; and the reputation has ever since continued.

Changes in Type.

The matter of getting White Wyandottes down on legs and broadened out was pushed by the breeders. Probably the greatest incentive towards this was an old bird that Doctor Howland of Worcester, Mass., brought from a peddler and sold to John B. Felt; a chance bird undoubtedly, but one that mated, as John Felt's son-in-law, Mr. Green, mated him—consistently produced big, broad males. About the only bird I ever bought to show, I don't know but what it was the only one, was a bird that was shown in Providence and Felt beat him. I bought this bird by mail for \$10, washed and fitted him and won everything in sight in Boston. You

American Poultry Journal, 523 Plymouth Ct., Chicago

could not see the bird for the ribbons Drevenstedt stuck on to it.

Felt protested and as always it amounted to nothing. My dear young friend, never do that. If you must spend \$5 to relieve your feelings, just go out and kick up such a racket that the judge of the court will say "\$5."

Then came the Cheston-Smith period with one of them judging New York and the other showing, and reversing at Boston; great, long feathered birds winning in one show, and hard feathered ones in the other; for Smith never adopted Cheston's type. Enough others did to almost put the breed on the blink. Those short, coupled-up, long, loose-feathered birds produced tiny eggs and few of them.

Then came a period of normalcy. There were Castle Farm, George Dakin and others. During all this time Johnny Andrews, myself and perhaps one or two others continued to saw as much wood as possible.

Don't this briefly stated history of the White Wyandottes tell you the story of an "old one"?

Modern White Wyandottes.

Now let us consider what manner of fowl we have and without a feeling of jealousy or a desire to knock compare the breed with other breeds we hear loudly proclaimed.

Since I have gotten back into the center of things as you might say, I have wished so many times that the breed had a club secretary who had the nerve, the push, the ability that the secretary of the Rhode Island Red Club has. I do not wish to hurt our secretary's feelings, for he may have all the necessary qualifications for success without the big fund of money that the Red breeders have to work with.

Comparisons may be odious, but everything in life comes down to a matter of comparison, and if fairly made there should be no feeling engendered.

There are many good breeds and a true fancier can admire and appreciate a choice specimen of any variety. Take a good Rhode Island Red; it is handsome, but as a thing of beauty it is not to be compared with a White Wyandotte, nor as a practical fowl either.

During the three years I run a public market, I made a specialty of fresh dressed poultry, having a class of trade which appreciated plump, well meated carcasses. There never was a Red carcass that compared in quality that had the breast meat, that was tender, soft and juicy eating as were the White Wyandotte carcass. For an honest truth I had customers who absolutely refused to eat Red chickens, claiming them dry, hard and stringy.

As far as I know, in every laying contest running today the White Wyandottes are in the lead.

The secretary of the Red Club did a big thing when he interested several big breeders in the Storrs' egg laying contest.

I would like to see more pens of White Wyandottes in the egg competitions and greater interest shown by our breeders. For years this breed has topped all others in these contests, and knowing the breed and the breeders, I do not believe they could possibly pick out pens of ten hens that would perform the remarkable feats that some of the pens of other varieties have done, such as one egg in twelve weeks; or eight eggs, or such a matter, in the same time! All the pens in these con-

Blatchford's Chick Mash is sold in 100- and 25-lb. bags and in 4-lb. cartons. At your dealer's

Before you buy any other feed for starting and growing this spring's chicks send for a trial carton of

Blatchford's CHICK MASH

formerly known as Blatchford's Milk Mash

If you are going to raise chicks this spring you want to raise as near 100% of them as is humanly possible. You do not want to see about half of them die off because they are *improperly* nourished, or because they are *under* nourished. That is usually the fate of 40 to 50% of all the chicks that are hatched. But it is an *unnecessary* loss. It can be *prevented*. It can be prevented by *starting* and *growing* your baby chicks on *Blatchford's Chick Mash*.

Blatchford's Chick Mash is the new name for *Blatchford's Milk Mash*—the milk-substitute mash that shields young chicks from white diarrhea, bowel trouble and leg weakness—the mash that keeps chicks *in condition* all the time, and *growing* all the time. *Blatchford's Chick Mash* is new in name only, however. In all other respects it is identically the same as *Milk Mash*—the feed regarding which H. Cecil Sheppard, Berea, O. says, "I would not attempt to raise chicks without it"—the feed upon which Chas. G. Pape of Ft. Wayne, Ind., starts and grows all of his famous prize winning Black Minorcas—the feed that hundreds of other prominent breeders and thousands of small and large poultry keepers everywhere put implicit confidence in because it *starts* their chicks *right*, *grows* them *rapidly* and *matures* them *early*.

4 lb. Trial Carton for 50 cents

Have been feeding Blatchford's Milk Mash (now Chick Mash) several seasons, last year raising about 3000 without a single case of bowel trouble. Out of 1150 hatched about three weeks, I have lost 4. Harry L. Bancroft, Kinderhook, Ill.

I have used your Milk Mash (now Chick Mash) for a number of years and there is nothing better as a starter for baby chicks. Out of 100 chicks this season I have only lost 2. This was my own fault, caused by neglect. Chas. W. Huber, 220 West Allmon St., Salem, Ill.

I have been feeding your Milk Mash (now Chick Mash) and have raised better than 97% of the number I hatched this spring. I have cockerels that weighed 41-2 lbs. at three months of age. H. A. Davies, Dodgeville, Wis.

Raising chicks without Blatchford's Milk Mash (now Chick Mash) is what Sherman said about war. I am like Mr. Sheppard of Berea, Ohio—I would not attempt to raise chicks without it. L. D. McVey, 3208 Live Oak Street, Dallas, Tex.

Blatchford's Milk Mash (now Chick Mash) is the only thing I have found that absolutely prevents white diarrhea and the chicks do well on it. J. E. Sloan, Prop., City View Poultry Farm, Ashland, O.

Blatchford's Chick Mash is undoubtedly handled by your local feed dealer. Get a supply from him and have it ready to start your chicks as they should be started. If, however, he does not handle it, accept our special introductory offer of a 4 lb. trial carton for 50 cents (shipped anywhere in the United States, all charges prepaid). (The only way you can possibly find out how thoroughly efficient Blatchford's Chick Mash really is for starting and growing baby chicks is to *try* it. This offer makes it possible for you to try it at small expense. It is an offer you should accept *at once*. It will insure you greater success with your chicks this spring than you have ever had before. It will enable you to start your chicks right and grow them rapidly. It will be the best 50 cent investment you have ever made. Use the coupon below. Send it to us *today*. A 4 lb. carton will be sent you immediately.

Blatchford Calf Meal Company
Dept. 6023 Waukegan, Ill.

Send this coupon and 50 cents for a 4 lb. trial carton of Blatchford's Chick Mash—postage prepaid

Blatchford Calf Meal Company Dept. 6023 Waukegan, Ill.

tests are not record smashers; you are sure to land up pretty well with your White Wyandottes, so why not enter?

How many came to me at our booth in the recent Boston Show and said that they were tired of the breeds they had taken up and were going back to the best all-round breed today, the White Wyandotte. Fifty percent of White Wyandotte chicks are not culls, either.

During my market experience I was so fixed that I would dearly loved to have turned the compliment of buying birds of a certain party, but could not. Why? Because he raised Leghorns. I tried faithfully to sell them but they are too small. There is absolutely nothing to the carcass.

In the contests they are not making a formidable showing as layers. One of our big practical farms, one claiming to sell utility Leghorns, states that it requires six months for the Leghorn pullet to mature. For heaven sakes, if it takes that long why not have a real bird, one that lays and has the plumpness, meatiest, most deliciously flavored meat of any and all of the breeds?

It has seemed to me that the numbers of breeders of White Wyandottes had not kept up during the war, and that the tendency was to confine the business to a very few breeders, so I was made glad when I received the catalog of the recent New York show to see the number of different exhibitors. This shows to me a healthy condition and every breeder should do all he can to encourage the new exhibitors.

I remember well how, as a beginner, I appreciated a word of recognition from the leaders of the day; how a few hearty words from Hawkins would

thrill me. I remember, too, how Philander Williams' eyes would twinkle as he came up and talked over your shoulder while looking at your birds. How it was food and drink to hear the discussions by fanciers, whether the subject drifted to Barred Rocks or other varieties. I say again that every exhibitor should make it his or her business to go over the birds of the new exhibitors, and with kindly criticism help them. Thus the novice will learn something of the fellowship of poultrymen and be encouraged to breed on and show again, firmly convinced he will have a good time and get to the top if they will only persist. Just remember this next year.

We want breeders and exhibitors and lots of them. Then we can let the whole world know that the White Wyandotte is the best breed on earth and that the White Wyandotte breeders are the best, cleanest and most helpful breeders in the business.

A Good Hatch Under Difficulties.

December 16 I set a Rhode Island Red hen on fourteen Ancona eggs, placed her in a small box in an ordinary open front hen house. During the latter part of December the mercury stood for two days and nights around zero, and on Jan. 7 I took off fourteen fine chicks.

If any of your subscribers can beat this, would like to hear from them.

Missouri. B. B. Smith.

Chicks in Idaho.

I will call attention to water grass seed as a ration for growing chicks, as I have noticed that chicks grow most amazingly fast where there is plenty of water grass, and require but very little feed, and develop into extra good layers. Water grass thrives best in ditches or any place where there is plenty of water.

Idaho. T. B. COLE.

what about the hens at your house!

Are the hens at your house laying all the eggs that they should? Have they been laying right through the winter? Do they pile up a good average at the end of the year that spells dollars in profit to you on each and every hen? Let us consider the merits of this wonderful family of Brown Leghorns, then, known as Everlay Brown Leghorns, and what we think they will do for you. The business of laying eggs has been so everlastingly bred in them that they easily made a World's Record at the American Egg-Laying Contest.

Everlay Brown Leghorn hens have been laying so faithfully and making so much money for their owners that the name and fame is spreading all over the land! There is Mr. Luttrell of Kentucky, who averaged over \$5 per hen after all costs were paid, not counting the eggs the family ate. And Mr. Fisher of Colorado made \$7.50 from each of his pullets in ten months.

We believe this wonderful family of Brown Leghorns can help you, too, to greater profits. They are so active, work so hard, they produce more eggs on less feed than any other fowl. Their fine white eggs always bring a premium on the New York market. Everlay Brown Leghorns are so hardy, vigorous, full of life and easily raised—we know you will like them and greatly admire their beauty. For many years they have been winning the most coveted prizes at America's biggest shows.

Our big new Brown Leghorn book is filled chuck full of practical pointers, how to feed and care for Brown Leghorn chicks, mating and breeding for eggs and how we developed this wonderful family of layers. Tell me whether you are interested in a flock of layers, prize fowls, chicks or eggs when you send for the Brown Leghorn book which is free. Send for your copy today.

We have some fine pens mated

for you, ready to ship, 4 pullets and cockerel, special price, \$50. Guarantee safe delivery stock or eggs anywhere. You take no risk.

**137 Eggs
in 150 Days**

A POULTRY DETENTION HOSPITAL.

The fact that no poultry farm is complete without a detention hospital was taught me by a discouraging experience at the very beginning of my entrance into the poultry business.

I had invested a couple hundred hard-earned and religiously hoarded dollars in White Leghorns, and nearly five hundred more in an up-to-date hen house and scratching pen. The remainder of the thousand we had been three years saving for the new business was expended in extending water supply, and in grains and other feed for the chickens.

Mrs. B. and I had spent the greater part of our leisure hours for months reading up on the raising and care of poultry, and during our sleeping hours we dreamed we were the proud possessors of pen after pen of blue ribbon birds which laid golden eggs, or eggs which meant gold dollars to us.

When we had added the last dollar to the little pile to make it the thousand we wanted to start our gold egg factory running, we dared not send our complete order to one dealer lest he be not thoroughly honest or that he might send inferior birds. So we divided the order into three parts and sent to three different firms in as many different states.

It is not such a bad plan for a beginner to send to different localities for fowls to try out which can stand his particular climate or altitude the best, provided he keep each lot by itself for a time. We did not do that and it spelled disaster.

The two first shipments were from states centrally located like our own and in a similar altitude. The birds came through in fine shape. Every one of them looked bright and was lively and we felt that we were about to have our dreams realized.

The third installment came from a greater distance and from a considerably lower altitude. As I was placing

the last fowls into the house we noticed that two of the pullets had a discharge upon the upper part of their bill and their eyes looked dull. My wife suggested that I keep those birds cooped by themselves for a few days lest they infect the others, but I did not have any extra coops or boxes at hand so I put the sleepy-eyed pullets with the

flock. "They may have taken a little cold in the rain," I told Mrs. B. "or they may be just tired. They will be all right in the morning."

But in the morning the two pullets were dead. "No use crying over dead pullets," said my philosophical little partner, "we will simply have to make

EGGS FOR HATCHING

The parent stock must be right if you want to hatch strong, livable chicks that will make a good run in the brooder. You must have vigor and stamina developed to a high degree and to get all this you must have

Cooke's Royal White Wyandottes

No hen that has not produced over 200 eggs per year is used in my breeding pens. They are mated to tested cock birds. For sixteen years I have bred Standard White Wyandottes for great egg production. By careful trapnest records and matings I have been able to increase egg production each year until now I feel I can say without fear of successful contradiction I have the greatest laying flock of White Wyandottes in America.

Book Your Orders Now

Owing to great demand for both stock and eggs, let me say: Don't delay—order early—as supply of both is limited. Fair treatment and satisfaction guaranteed on every sale. Get my large catalog today and be convinced that I have what you are looking for.

50 High Grade Cockerels and Pullets

from my best pedigree, trapnested layers, with egg records in pullet year up to 293, are offered at reasonable prices. Cockerels from my great tested cock birds are in this offering for your foundation stock. All stock is farm range, vigorous and hardy.

PHILLIPS SINGLE COMB BUFF LEGHORNS

I have been breeding them for seven years and have accomplished three things: good, even golden color; a strain that lays at four months, can furnish affidavit from one of last year's customers; and have lots of birds good enough for any show room. Pen No. 1, per setting, \$3.00; pens No. 2 and No. 3, at \$2.00 per setting. Special price for 100 lot. Write for information.

S. W. PHILLIPS,

Mattoon, Ill.

the rest lay the eggs which these would have given us."

Three days later our son told me that he thought one of the new pullets had something stuck in her throat because he could hear her breathe clear across the pen. I examined her throat but found no lump or swelling. Then I ran a swab down into her crop; nothing stuck there that I could detect. Three days later that pullet died and two others began to wheeze.

We became alarmed and interviewed a friend who had had considerable experience in poultry. "It's a sort of influenza," said he. "Give them sulphur and red pepper and put kerosene on the roosts and they will come out all right."

The next day we cremated two more crates of our golden dream eggs, but, as all the remaining birds looked bright and seemed lively and hungry we felt sure that we would not have any further trouble with the disease which the last shipment of chickens had introduced.

Several days later we found another dead pullet when we went out in the morning to feed them. We called in another chicken expert and he proved to be a veritable Job's comforter. "It's a very infectious disease, no use trying to do anything for them. You'll lose the whole bunch. Wring their necks the first sign of a watery eye or wheeze," he said.

Our golden egg dreams vanished and in their place came haunting nightmares of empty nests and bank account in the red. Whenever Mrs. B. breathed hard in her sleep I was sure I heard those pullets wheezing way out in the hen house.

The following morning there were two more wheezy birds and I was about to follow my friend's advice and wring their necks when my more optimistic wife suggested that we purchase some large dry goods boxes and make a detention hospital of them. "We can experiment with the sick chickens, said my wise little partner, and perhaps we

can save them and the rest of the flock.'

"Too late," I retorted, "we should have kept the first two sick ones away from the flock. They have infected the entire bunch." No, the little woman did not taunt me with, "I told you so"; I suppose she saw I was having my punishment.

I secured some boxes, and as soon as a bird looked watery eyed or acted dumpy I put him into a ward of my detention hospital. Also, I thoroughly fumigated the hen house, burned all the old litter, and scalded the food dishes and the drinking fountains.

Just as soon as one of the hospital birds looked and acted well we put her into the convalescent ward and kept her there until we considered the deadly germ inert.

Only three more of the pullets died. The hens which became infected of the first shipments recovered. They were evidently a stronger bird and had greater resisting power.

So, by careful watching and culling out the infected chickens, we managed to save the greater part of our flock though I feel sure that if it had not been for our detention boxes we would have lost all, or nearly all of our expensive birds.

Since that trying time we have built a substantial detention hospital with separate wards and so constructed as to make every part of it easily and independently fumigated. And, believe me, I never again placed new shipments of fowl with the flock until I had tried them out a few days.

South Dakota. Stephen Brewster.

An Experience in Trap-Nesting.

The question is often asked, "does it pay to trap-nest?" It positively pays. But it will not pay the careless one. Fourteen years ago I decided that I would try out trap-nesting.

I started with the calendar year. On the first day of January, 1906, I began taking the individual egg record of ten Black Langshan pullets hatched the previous May. It seems absurd now to tell you that what I then thought to be my best bird laid only 86 that year. This was a nine-pound pullet which looked good to me then because of her robust (now masculine) appearance. A smaller, more active pullet, laid 160 eggs. She was my highest layer. Three others fell in between 150 and 160. I kept these four and bred from them the following year.

In the year 1908 I tested 20 pullets reared from these first trapped, highest record four. Nine of these 20 passed 150 eggs, the highest laying 176. In 1909 I bred from the six best of the nine, mating them to a cockerel purchased from Nelson Rice of Indiana.

In the year 1910, by a strict individual record I reached the then unbelievable "200" egg hen, and then set that for my Standard, and have never bred any two-year-old hen that did not lay more than 200 eggs in her first year. By this careful selection of the highest layers, also being careful that my male birds were from the most vigorous and vital mothers. I kept climbing until, in 1915, I was bold enough to send a pen of April hatched pullets to the egg-laying contest at Mountain Grove, Mo. They did not become quickly acclimated, and did not begin laying as early as their sisters at home; yet No. 995 laid, according to Mr. Quesenberry's report, 223 eggs.

I kept this hen, No. 995, "Miss Missouri First," and in 1917 I raised some great birds. In 1918 I kept four of her pullets, and the sum total of the eggs laid by the four was 1024 eggs. I would advise taking the individual record of a goodly number of pullets each year; have no male bird with them; then select only a few of the best and mate them to the right sire in their second year, and by this means your flock constantly grows better.

J. R. BROWN.

Virginia.

Robadel Orpingtons WHITE—BLACK—BUFF

Again demonstrate their superiority at the Great Madison Square Garden Show, January 18-22, 1921

AS FOLLOWS:

WHITE ORPINGTONS—Best Display, with 28 birds wearing ribbons. This is the third year in succession they have accomplished this feat.

Hart's New Brooder

My brooder plans tell how to make a brooder for 100 to 500 chicks. Use one burner oil cook stove for heater. I threw out my coal and distillate stoves when I invented this system. No thermometer or thermostat needed. No over-heating, chilling, worry or grief. No burnt air in the brooder room or hover. Don't need to teach chicks to roost. A child can operate it. Very simple. Turn any old shed into a brooder house. Directions for new house. Feeding directions for chicks tell not only just what to feed, but exactly how much—right to the ounce—no guess work. No gapes, toe-picking, leg-weakness, diarrhea, etc., in our chicks.

My book also contains my feed formulas and methods that save me 25c to 50c a hen a year, and produced fourteen 300-egg hens out of 450 pullets. How I fed a test pen of 90 pullets one grain feed a day, and got four 300-egg hens. Other items are self-feeding hoppers that are waste-proof (my new idea may work on your hoppers to make them waste-proof), artificial lighting, self-cleaning chicken crates, self-cleaning nests, sanitary dropping board with miteless roosts, No. 1 Mite Paint at 10c to 25c a gallon, wet mash mixer for 500 to 1,000 hens for \$1. Valuable items on feeding and culling. How I selected the pullets from the general flock to be trap-nested at Salem that made so many high producers.

HART'S POULTRY BOOK with Brooder Plans, \$1.

MRS. ELY BROYLES, CARROLLTON, MO.

MY HATCHING EXPERIENCE.

It is less work whether we think so or not, to hatch with the incubator than with hens; and it can be done quite as successfully.

I have used several kinds of incubators; both hot water and hot air. I prefer the hot-air machine. I am now using a machine that is simple in its make-up and easy to handle. The tray can be placed on top for cooling and turning the eggs and the lamp is easy to remove and replace. It fits in tight so there is no loss of heat. The walls are effectively insulated and one does not have to cover the incubator with a rug at night or when the mercury drops. There are many good machines, however, and more depends on the operator than on the machine.

An operator who forgets to fill the lamp does not deserve a good hatch. Neither does the one who puts his tray on top for cooling and leaves it there a half a day, because the baby is cross or company comes unexpectedly; nor the one who forgets to put back the center eggs taken out to facilitate turning. I might add: It is easy for the busy housekeeper to make all these mistakes.

I have had equally good success in a basement and a north room. For a woman who has a thousand and one other things to do, it is handier to operate the incubator on the same floor as the kitchen; utilizing, perhaps, an unoccupied room in which an incubator can be placed.

Most books of directions say to light your lamp and bring temperature up slowly, regulate and run at hatching temperature a few days before putting in eggs. I obey all of the instructions except the last part: I run at hatching temperature (102 for first week) until the morning after regulating. If the temperature still stands at 102 degrees I put in the eggs. I watch the temperature when it reaches 102 degrees. I find it is apt to go a trifle higher after the eggs are well warmed up than when empty. I always test the thermometer. If there is a break in the mercury jar it down.

I select my eggs carefully, taking those of medium size and shape, rejecting long slim eggs and round eggs that come from hens that usually lay long ones.

I once had a neighbor who believed that all long eggs would produce roosters and round ones pullets. He frequently came to me for eggs for hatching and he would always say: "Give me the little round ones."

I then had a pen of Silver Wyandottes that usually laid good long eggs, and the old man picked out the culls in order to get pullets. Invariably he reported a poor hatch, and although I tried, I was never able to convince him that it was his own fault.

Then eggs with a rough shell should be rejected because such shells are porous. The first eggs of pullets seldom or never hatch, and should not be used for hatching until as large as the eggs of a hen.

I try to keep the temperature at 102 the first week and after that at 103 until hatching time when I let it go up to 105 but never higher.

The morning of the second day I take out the tray and turn it a quarter the way round. In the evening I turn it quite round, but do not disturb the eggs.

On the morning of the third day I

SPECIAL OFFER

We want to
GIVE YOU A 100-lb. SACK
OF THIS POULTRY FEED

For a limited time we are offering a 100-lb. sack FREE with every purchase of five sacks of Golden Grain Laying Mash. We want you to try this feed—to see what big returns you will find in it from increased egg yield.

GOLDEN GRAIN LAYING MASH will increase the yield of your hens three or four fold. It will make each hen produce 250 eggs a year where she now lays only 60 or 80.

Send your order now. You will receive your supply of Golden Grain Laying Mash in a few days. Within a week you will notice the increased yield from every hen.

The price is low—only \$2.75 for a 100-lb. sack, f. o. b. East St. Louis, Ill. You get six sacks for \$13.75, the price of five—**ONE FOR NOTHING.** It's an offer you can't afford to neglect.

GOLDEN GRAIN MILLING CO.
320 S. 17th St. East St. Louis, Ill.

It is a wonderful developer for baby chicks.

Remember, you get an extra sack FREE with every five sacks.

Send in your order today.

Sick Baby Chicks?

There's no excuse for losses beyond 10% to full maturity. Baby chicks are tender and susceptible to diseases—just as an infant—but it's natural for them to live and thrive. Give them the proper protection and care and they will grow into money for you. I'll tell you how. I've helped thousands of poultry raisers during the last twenty years and have thousands of letters thanking me. I'll show you how to raise at least 90% of your hatch, get more eggs, make money. Here's my proposition:

MONEY BACK IF NOT SATISFIED

My Germozone, on the market a quarter of a century and used continuously by many during all that time, is both preventive and curative—a remedy for roup, colds, canker, diarrhoea, swelled head, chicken pox, bowel trouble and all such ailments of poultry and pet stock. With this I give **ABSOLUTELY FREE** my two books, "Care of Baby Chicks" and "Lee's Poultry Book." These books tell how to avoid the pitfalls and mistakes that cause so many to fail in poultry work. Tells how to house and feed and care for chickens, how to detect diseases, how to prevent sickness and how to overcome ailments already present. Every bit of advice is based on common sense and actual experience.

Get a package of Germozone tablets—25c and 75c sizes—from your dealer or direct from me. Use Germozone and follow my directions for 60 days. If you are not entirely satisfied return the empty carton, with this advertisement, to the place where you purchased the Germozone and your money will be returned to you immediately.

I make this remarkable offer because I know you will get far better results. Start today. Thousands of others are having big success with my remedy and my system. You can make your poultry pay.

At your drug or seed dealer, or direct, C. O. D. if desired, from

GEO. H. LEE CO. Dept. P-2, OMAHA, NEB

take out tray and begin turning. I take out about twenty eggs from the center of the tray and put them in a box or basket kept for the purpose. Then I put the eggs from one corner into the center, turning them over, and then gently roll all of the other eggs so as to change their positions. The eggs taken out should then be put in the last corner. Now put the tray back, turning one-quarter the way round. I do this every time I turn the eggs.

My plan is to be sure not to leave any eggs too long in the warmest or the coldest spot; and there is a warmest and coldest place in most machines. I try not to keep the eggs out too long the first week. I turn twice a day but at night I do not cool any longer than is necessary in turning.

After the first week I cool eggs in the morning before turning, from 10 to 20 minutes from the seventh to the eighteenth day. I do not leave them out long when the room is cold.

Test Out Infertile Eggs.

On about the fifth day I candle eggs to get a few out, thereby making it easier to turn and to handle the tray.

I use a home-made candler and work in a south window on a bright day. If there are any doubtful, I mark them D and put them back for a few days.

I often use these infertile eggs in cooking and sometimes cook them at once for the prospective chicks. An infertile egg is perfectly clear and free from blood rings or other signs of development.

When the first half of the eggs are candled I take out those that are in the incubator and put the ones candled back.

About the sixteenth day I candle again when it is easy to take out dead germs.

I fill the lamp about 4 p. m. and look at the temperature before I turn later in the evening. If it is right, before turning, it will go back again when eggs warm up. If you fill lamp when you turn at night you may not have the same flame and the temperature is apt to go up or down in the night.

I always rub off the charred part of the wick and trim it with sharp shears once or twice a week, cutting off the corners so as to have an even flame.

Then I clean the outside of the lamp carefully. If that is not done and oil is spilled on lamp it is sure to smell. Whether the incubator is in the basement or not I put a saucer of warm water under the tray about the seventh day and keep it there until I have to take it out of the way of the chicks. I think more hatches are spoiled from having the eggs too dry than too moist. I have tried other ways of introducing moisture, but believe the dish under the tray the best. If moisture is needed after the chicks begin to fall into the nursery I put a wet sponge in the tray.

I usually turn the eggs on the morning of the nineteenth day and I then close the machine until the hatch is over. I partially close the ventilator in my machine. The temperature should be kept from 103 to 105 degrees during the hatch. There is danger of too high a temperature while the chicks are coming out and too low for the unhatched chicks while the first are drying off; and at this time the temperature needs to be watched.

Last spring I read an article stating that the pullet pecked nearer the large

KNAPP'S "Hi-Grade" CHICKS

Take An Expert's Advice:

Don't buy chicks because they are cheap. They may be mighty expensive in the end. Why not start where my thirty-eight years' experience leaves off?

My "HI-GRADE" chicks are the result of years of patient study and hard work. I have finally combined Standard quality and high egg production. If you desire birds of beauty that will produce the maximum number of eggs, order "HI-GRADE."

TWELVE POPULAR VARIETIES

Shipped by Prepaid Parcel Post.

97% Safe Delivery Guaranteed.

Listen to What Our Customers Say:

"I am surely proud of my Buff Leghorns, so uniform in size and color. They commenced to lay September 20."

"Your White Rocks are the best layers I have ever owned."

"Won three blue ribbons at our recent show."

"Your White Wyandottes cannot be beat as layers."

"Am getting \$1.20 per dozen for eggs from my 'High-Grade' Black Minorcas."

"Enclosed is my order for 3,000 S. C. White Leghorns; same as last year."

I have hundreds of testimonials like these. Haven't my "HI-GRADE" chicks made good? They will do it for you. Remember I have shipped millions of chicks.

Prices Are Reasonable. Send for List.

CO.** 523 Plymouth Court Chicago, Illinois

end and the cockerel nearer the small end of the egg, and I determined to try it. I took out 30 Rose Comb Buff Leghorn eggs and selected 15 pecked nearer the small end and put under a setting hen. She had all cockerels but one. The other 15 pecked near the large end were all pullets but three. I am going to try this again.

Although I have had reasonably good success in hatching I have never hatched every hatchable egg. Once, late in June, I hatched all but three and got 117 good lively chicks from 120 eggs.

I think the condition of the stock has more to do with good hatches than anything else.

I think with my Buff Leghorns I get better hatches and stronger chicks from pullets when they are mated to cocks. That may be true only of this breed. I think, too, that I get more pullets and fewer cockerels from such matings. Next year if I am permitted to continue my work here, I intend to have yearling cocks in all my pens and also one or more with my flock that has the range.

I have tried to tell a few of the things I have learned and now want to tell what I haven't learned.

I have never been able to get more than a 30 percent hatch in February and not much better in March, unless the breeding birds could get outside. With my Buff Leghorns as soon as they have been out a week or two the eggs are all right, but with the larger breeds it takes longer.

Minn. Abbie F. Johannessohn.

Mating Bantams.

Upon the skill of mating depends the success of the fancier. It takes study, thought and foresight to select and mate to produce Standard type and color. Just recently I have seen old breeders select color and overlook shape. In mating bantams, as in mating large fowl, one must select type. Some of our most successful breeders believe the female the most important and will not sell the best females for any amount of money, but will sell some of their finest males. Great care should be exercised not to mate male and female with the same faults. For instance, if you have a fine male in most every way but carries his tail just a little high, be sure and select a female that is heavy feathered over base of the tail and carries her tail low and well spread. You may not get the right carriage in the tails of all the chicks, but you may get one or two that are good in this respect. These can be used to mate with your best hens. In this way you can overcome high tail carriage. In mating for buff color, select your typical male with color nearest the Standard. With him mate females that are strong in color where he is weak. If he has good even surface color and a little light in undercolor, select one or two females just a shade darker and strong in undercolor. This mating usually brings good pullets. For cockerels select your best shaped and colored females and mate a cockerel somewhat darker in color but have him even as possible. Pay special attention to health and vigor in your breeding stock; never breed from birds that have been sick with roup and canker, and always use your best birds to breed from and keep a record of the matings so you will know just what mating produces the best stock.

Prepotency.

The breeder also finds in his experience that certain birds prove to be superior breeders by virtue of their prepotency. In other words, some birds possess the quality of being able to stamp their characteristics to a great degree upon their offspring. Unfortunately this is a quality which

cannot be determined by the appearance of a bird or in any other way except as the result of breeding the birds. Where prepotency manifests itself in a favorable direction the birds possessing it are of course very valuable as breeders and should be bred as long as they are in good breeding condition.

No matter how carefully the birds are bred, no matter to how high a degree of excellence they have attained, there is always a tendency for them to go back toward the average for the variety or strain, or in other words, toward quality which is not as high. This tendency is known as the principle of regression, and is one which makes it impossible for a breeder to rest upon his laurels once his stock has reached a high degree of excellence for just the moment that he ceases his effort to maintain quality to the highest degree he will lose some of it regardless of the blood lines.

Off-Colored Feathers.

It might be well to mention here that complaints are frequent from purchasers of stock, of baby chicks, or of eggs for hatching, that the stock shows off-colored feathers, and the inference is drawn that it is not therefore purebred. It must be understood that off-colored feathers are common in occurrence in some varieties, and that their appearance does not always indicate impurity. An example of this is the black body feathers which occur in Barred Plymouth Rock females. These are not seen in the fowls exhibited simply because they are pulled out. Smoky colored down in White Plymouth Rock chicks, and white chick feathers, particularly in the wings of black varieties, are common, but are usually lost as the chick grows and are not an indication of impurity of blood.

Occasionally sports occur. These are offspring which differ radically in certain particulars from either their immediate parents or any of the known ancestry. Such birds are said to be sports, and since they tend to breed true, the breeder can take advantage of such an occurrence to make a big stride ahead quickly, if the sport is in a desired direction. For instance, the White Plymouth Rock is commonly credited with being a sport from the Barred Plymouth Rock. From a Barred Rock mating white chickens occurred which were bred and perfected into the White Rocks. The occurrence of these white sports made it possible to establish a white variety much quicker than would have been the case by crossing the Barred Rock with some white breed.

**Which Breed to Choose?**

The Answer Is

Rhode Island Reds

Because Rhode Island Reds are the most beautiful and most profitable fowl of today. They thrive and make good in all climates.

Rhode Island Reds are known to be among the world's greatest winter layers. At the National Egg Contest for 1920 Rhode Island Reds made the highest pen record and the highest individual record for the year. At all the egg-laying contests the Reds, during the fall and winter, have carried off more honors than any other breed. This is the inevitable result of the fact that Rhode Island Reds are the only breed whose standard of type does not conflict in any way with the government standard of egg type.

Rhode Island Reds are a splendid market fowl. Their meat is sweet, juicy and fine flavored. They fatten up well, and make plump broilers and fryers at an earlier age than do other breeds.

Rhode Island Reds are good hustlers, and the females make good mothers, still they are easily broken from broodiness when not wanted for setting.

If you want to raise a breed that embodies the good points of all other breeds without having any of their faults, then breed Rhode Island Reds.

For literature and valuable information on this remarkable breed, address

Wilbur's Columbian Plymouth Rocks

FIRST PRIZE COCK
Madison Square Garden, New York, 1919

Winners at New York and Boston

Frank Platt, in American Poultry Journal, writes of my Boston exhibit: "Columbian Rocks show a pleasing advance over any class that heretofore has been shown. First, second, third, fourth and fifth cockerels free from brass, good quality birds and five better ones have not been shown by any breeder. First cock, a clean colored bird, good substance and nice type. The entire line has a sharp eye, pronounced in richness of color. These beautiful birds should make many new friends for they are well worthy of having."

FACTS TALK

And they are further evidenced by the report of the leading poultry papers. It is absolutely impossible for you to go wrong when you buy my practical, profitable and beautiful strain.

My Columbian Rocks are prolific layers of large uniformly well shaped eggs. The chicks are hardy and develop rapidly when given just ordinary care. Pullets mature in from five to seven months.

Hatching Eggs, Layers and Breeding Stock

from my great prize winning strain, that I have for sale are all listed with price of each, in my 1921 illustrated circular and mating list, which contains many photos of my prize winners. Write today.

kegs, 5 gals., \$7; 10 gals., \$12. Freight
prepaid anywhere for 10 percent of in-
voice. Write for literature. Agents
wanted.

LUDWIG REMEDY CO. ST. LOUIS, MO.

Conkey's The Starting

Conkey's Buttermilk Starting Feed carries your little chicks safely through the critical first 8 weeks. It is an appetizing combination of pure, sweet grain and concentrated sanitary Buttermilk.

It prevents the big losses due to weakness and disease; it gives your chicks the quick snappy getaway that produces early broilers and layers. Lactic acid in buttermilk is an "intestinal broom." It helps to sweep away the germs which are usually the cause of White Diarrhea. Buttermilk itself has a relishing, tonic effect on poultry, especially when combined with clean, sweet, plump grains, as Conkey alone knows how.

Conkey's Made by **THE ORIGINAL** Process No Dried Buttermilk Ever Used

Conkey's is different—Conkey makes the *only, original Buttermilk Starting Feed*. Conkey never uses "dried-out" powdered buttermilk. By THE ORIGINAL process which is exclusively used by Conkey, wholesome buttermilk, with its tart appetizing taste, is thoroughly incorporated with the other ingredients. However, it's not the buttermilk, nor the grain alone—its THE ORIGINAL Conkey process of combining them that produces such wonderful results.

Low in Fibre—Just Right in Protein

For baby chicks, feed with a protein content in excess of 14 per cent is dangerous, as the delicate digestive system cannot assimilate it. Conkey's Buttermilk Starting Feed runs 12 per cent, the ideal average.

A fibre content of more than 5 per cent is very injurious to little chicks. Conkey's is scientifically correct, for it runs only 4 per cent fibre. The correct balance of food elements and the high quality of ingredients make Conkey's Buttermilk Starting Feed the cheapest baby chick food you can use.

Too much fibre injures. Too much protein overtaxes. Conkey's is low in fibre and just right in protein. Read the guaranteed analysis of Conkey's and compare it with others: Crude Protein 12%—Crude Fibre 4%—Crude Fat 3%—Nitrogen Free Extract 56%—Carbohydrates 60%.

Feed It For the First Eight Weeks

When the chicks are hatched, give them clean water with the chill taken off and fine grit, but no feed for 48 hours. Then feed Conkey's Buttermilk Starting Feed dry, often but sparingly for the first few feeds, so they will clean it up, gradually increasing, and continue for eight weeks, with occasionally a little green food. If you do this, you should lose very few chicks on account of sickness.

Conkey's Buttermilk Starting Feed is sold at dealers carrying poultry feeds and supplies. Many dealers sell from one ton to 30 tons a season. It comes in 2½-lb., 5-lb. and 10-lb. containers, and 25-lb. and 100-lb. bags. If your dealer can't supply you with Conkey's, write direct to us and we shall see that you are supplied.

FREE—Conkey's Poultry Book

Send your name for a free copy of 64-page Book on Feeding and Raising of Chicks, Culling of Hens, etc.

Try This Fair Test

Take one-half your first hatch and feed them three weeks on Conkey's Buttermilk Starting Feed. Feed the remainder of the chicks on any other chick feed you please. Then compare the two groups and you will find the Conkey-fed chicks bigger, stronger, healthier and more active.

The G. E. Conkey Co. Poultry Feed Specialists 6531 Broadway, Cleveland, Ohio

Buttermilk

Original Feed

Conkey is credited with one of the most progressive discoveries given to the poultry world in recent years. THE ORIGINAL Buttermilk Starting Feed, as the *first* commercial poultry feed containing Buttermilk, placed Conkey in the front rank of contributors to poultry progress, but Conkey's greatest gift is the invaluable lesson he has taught in demonstrating the need of three different feeds for the most economical feeding of poultry. Conkey makes one feed for starting the chicks, another for growing and developing, and still another for the egg-laying period.

Be Sure to Get Conkey's in Original Package

If it isn't in the original package, it may not be Conkey's. Don't be misled by the use of the word "buttermilk," which is being used to cover a multitude of sinful grains.

Birds, like human kind, thrive best on things they like best, provided those things are digestible and nutritious. That is why chicks grow so fast on Conkey's—it's temptingly palatable, highly nutritious—at same time easily digested.

Buy a Bag of Your Dealer

Don't Worry!
Conkey Will Cure Me

Hatchery Assn. President Endorses Conkey's

Herbert H. Knapp, Shelby, Ohio, President of the International Baby Chick Association, writes:

"In our own plant we found Conkey's Buttermilk Starting Feed a life saver. Not a single case of White Diarrhea this season.

"Your chain of feeds was a happy thought. Three Buttermilk Mashers for Starting, Growing and Laying are complete and surely do bring results."

Please remember, a baby chick requires a special ration for the first six to eight weeks, just like a baby must have an infant's diet. For a developing, maturing bird, a heavier diet, too rich ordinarily for the delicate digestive organs of a baby chick, is necessary to develop sturdy bone and muscle. And, naturally, egg-production calls for a different ration. This simple, logical system of feeding which Conkey has presented to the poultry world since he first introduced THE ORIGINAL Buttermilk Starting Feed, has proven so successful that hundreds of imitators are springing up. These imitation buttermilk feeds, flooding the market today, are the strongest proof of the tremendous practical success and value of Conkey's ideas.

Prominent Poultrymen Use and Recommend It

U. R. Fishel, the well known breeder of White Plymouth Rocks at Fishelton Farms, Hope, Ind., writes: "Conkey's Buttermilk Starting Feed is the best feed for young chicks. I have found nothing to equal it in the forty years I have been in the business."

A. A. Carver, Specialty Breeder of Rhode Island Reds, Seville, Ohio, writes: "Have used Conkey's Buttermilk Starting Feed for years past with remarkable results. Before I used it I always had a large mortality of young chicks each spring. Thanks to your Feed, I have saved this great loss."

H. L. Holsinger, Manager of the Summit Poultry Farm, Ridgely, Md., writes: "We have found Conkey's Buttermilk Starting Feed unequalled by any other. Some of the other advertised feeds were tried along with it, but results from Conkey's were so much better that we feel there is no comparison. 2200 chicks, fed on your Feed, were raised to eight weeks old with the loss of only nine chicks. Can anything beat this?"

Conkey's Time-Tried and Proven Remedies

Conkey's Poultry Tonic is a Regulator, Laying Tonic, Molting Powder and Chick Conditioner, made with scientific care and used the world over. Contains no filler and no cayenne pepper. It keeps chickens hardy, thrifty and profitable.

Conkey's White Diarrhea Remedy destroys the germs that cause the trouble and allays the intestinal fever. It is a soluble tablet, given in the water. Keep a box in your Conkey Corner during the hatching season.

Conkey's Lice Powder is unequalled for ridding fowls of body lice. Very effective, yet harmless. Guaranteed to satisfy or money refunded.

Conkey's Nox-i-cide is the great poultry disinfectant and germ destroyer. It will prevent disease and save you trouble and loss. Use it constantly.

Conkey's Roup Remedy has been the standard remedy for Roup and Canker for 20 years. Keep it in the drinking water during fall, winter and early spring.

Send for a copy of Conkey's Poultry Book—a complete treatise on the care of Poultry. Cent free.

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

Win at the Premier Show of All the World
Madison Square Garden
New York, January, 1921

The Greatest Record of All Time

First Prize Cock at Madison Square Garden, New York, 1919—The Sire of First Prize Cock of 1921

Every Prize and Ribbon Offered

Cocks	- - - -	1st, 2d, 3d, 4th, 5th
Cockerels	- - - -	1st, 2d, 3d, 4th, 5th
Hens	- - - -	1st, 2d, 3d, 4th, 5th
Pullets	- - - -	1st, 2d, 3d, 4th, 5th
Young Pens	- - - -	1st, 2d, 3d, 4th, 5th
Old Pens	- - - -	1st, 2d, 3d, 4th, 5th

30 Prizes Out of 30 Offered

Sweepstakes Championship Male and Female and Every Special Prize—every bird bred on my farm.

This amazing record is an exact duplicate of the Imperial "Ringlet" record of 1920 at Madison Square Garden.

These 100% Perfect Records are the crowning achievement of the unexampled "Ringlet" Records at New York for more than 30 victorious years.

The competition at this show was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well,

Supreme at Madison Square Garden Is Supreme Everywhere

IMPERIAL "RINGLET" EGGS

You want eggs to produce the Silver Cup and Blue Ribbon winners for next season's shows. No other Barred Rock eggs have ever produced the extreme high quality birds as my Imperial "Ringlets." Hundreds of old customers order eggs every year—these eggs have brought them rich rewards in Silver Cups and First Prizes, and proved the foundation for many a money-making business.

My Imperial "Ringlet" eggs will place you in position to win at next season's shows. You may raise a single chick worth hundreds of dollars—hundreds of my customers have done this. **MY MATINGS ARE UNEQUALED IN AMERICA.** No such magnificent color and barring can be found on any living birds—as layers they stand pre-eminent.

My Eggs Are the Best Money Can Buy—They Produce First Prize Birds

Mr. E. B. Thompson, Amenia, N. Y.

Dear Sir: Just to let you know how the chicks have come along that I hatched out of the eggs I got from you last year. I won 1st Cockerel, 1st Pullet, and the pullet was Champion Female of the show, about 1,400 entries, so I am quite proud of my Imperial "Ringlets." The judge said that E. B. Thompson could put 125 birds in every class in any show room and all the other Barred Rock breeders in America could not get in between 1 and 125.

Sarnia, Ont., Jan. 31, 1921.

Yours very truly,
THOS. H. ROBINSON.

Grand Exhibition and Breeding Birds for Sale of This Richest First Prize Sweepstakes New York Blood. Elegant Catalog Mailed Upon Request.

EGGS From the finest exhibition matings in the world—one setting \$20, two settings \$35, four settings \$60, 100 eggs \$90.

This course is for the sole benefit of Ful-O-Pep customers. It consists of over 50 lessons dealing with a complete study of the great subject of successful poultry raising. Here are some of the lessons and bulletins:

The first lesson—The Commercial Egg Farm—Breeds and Varieties—General Purpose Type—Egg Type—Meat Type—Principles of Breeding—Natural Incubation—Natural Brooding—Brooder Houses and Equipment—Poultry Houses and Equipment—Care of Breeding Stock—Feeding and Management for Egg Production—Selecting the Laying Hen—Increasing Egg Production by Illumination—Marketing the Commercial Egg—The Day Old Chick Industry—Feeds and Methods of Feeding—Feeding Equipment—Growing and Marketing Broilers and Roasters—Feeding Young Chicks for Quick Maturity—Capon and Caponizing—Poultry Diseases, Treatment, Cure and Home-made Remedies—Sanitation—Fattening, Killing, Dressing and Packing—Conditioning and Exhibiting Fowls—Preserving Eggs for Home Use—Poultry Secrets Disclosed.

The above are only a few of the many subjects covered in this complete course—a course that treats on and fully covers every poultry problem from A to Z.

To secure this Poultry Course Free, simply go to your dealer, hand him the coupon below properly filled out, giving him the order for Ful-O-Pep Dry Mash, Growing Mash or Chick Feed, just your regular order, same quantity as you are accustomed to buy. Your dealer will sign the coupon. You mail it to us and we will send you your first lesson with text and list of questions for you to answer and so on, until you have received the entire course of more than 50 lessons. This service is free only to those who use Ful-O-Pep Feeds.

“ARISTOCRATS”

The World's Greatest Strain of Poultry

**Aristocrat
Eggs**

**Produce
Such
Birds**

Supreme as
SHOWBIRDS

Supreme as
LAYERS

Supreme as
MARKET FOWL

You will not be able to find anything which produces such sure profits, such safe profits, and such enormous clear profits, as the chickens produced from “Aristocrat” Barred Rock Eggs.

ARISTOCRAT CUSTOMERS are winning out in hundreds of showrooms throughout the U. S. and Canada, winning out in the very biggest and largest shows of all.

THOUSANDS OF SHOWROOM PRIZES are being won by Aristocrat customers—not only in local shows, not only in large state shows, but in the greatest national shows of the American continent.

ALL STATES of the Union, all countries of North America, all continents of the world, hail the “Aristocrats” as winners.

“Aristocrat” Barred Rock Eggs Are Producing These Wonder Birds. Why not get the greatest showbirds, the greatest layers, the greatest market fowl—all combined in one? (It costs no more to raise them than the ordinary birds.)

“ARISTOCRATS” Are the Truly Great “MONEYMAKERS”

Please note:

Two-Thirds of all my own “Aristocrats” are hatched out between April 20 and June 20.

W. D. HOLTERMAN, Fancier, Box A, FORT WAYNE, IND., U. S. A.

Will gladly send you My Grand Catalog and Special Booklet on Aristocrat Eggs.

Consistent Performance Counts--

IT ISN'T the appearance of the early swallow that makes the summer, nor the crow of the rooster that brings the day. It is the consistent revival of plant and animal life that makes summer, and the consistent approach of the sun that brings the day.

So, too, it isn't the occasional performance that makes a success of chick hatching. It is the week in and week out consistent success that counts--the hatching of the most eggs into the liveliest, largest and sturdiest chicks, and their brooding through babyhood to quick maturity through the season that brings the money.

Ability of Buckeye Equipment to do this has been proved by over half a million users, of all kinds, under all sorts of conditions and in all parts of the world, where its success has given it the deserved reputation of the world's standard, and made the demand greater than the output of any other three incubator and brooder makers combined.

Success follows the use of Buckeye Poultry Raising Equipment, because it is scientifically correct, built up to a standard of perfection, and workable under all conditions in the hands of the experienced or the beginner. It takes all the gamble out of hatching and brooding, bringing success instead of uncertainty, with almost automatic regularity.

Ask The Buckeye User--He Knows!

Buckeye Colony Brooders, for either coal or kerosene, have revolutionized chick raising by supplying just the right conditions of warmth, ventilation and sanitation. They have literally made three chicks grow where one grew before, reducing the expense to a third, and the labor to a fourth, and producing results in quick growth and healthy size that bring big profits.

See them at the Buckeye dealer's, or write direct to the factory for the Buckeye catalog.

The Buckeye Incubator Company

Standard Reliable Incubators and Oil Burning Hovers

FORTIETH ANNIVERSARY

Note what a few of the Reliable users have to say about our goods—they are successful and will last a lifetime.

Dorrance, Kan., Jan. 10, 1921.

Reliable Incubator and Brooder Co.,

We have one of your Blue Flame Hovers which we operated last year with great success. Had 425 Leghorn Chickens under it at one time and never lost a chick.

Ralph J. Keyser.

Washington, D. C., Jan. 11, 1921.

Reliable Incubator and Brooder Co.,

I have two of your larger size colony brooders and raised a lot of splendid chickens under them.

E. R. Dunn.

Mulga, Ala., Jan. 18, 1921.

Reliable Incubator and Brooder Co.,

Am manager of Alabama Leghorn Farms Company and have one of your Hovers, also I think that we have placed an order for several more. I think that they are the only Brooder.

A. C. Monell.

Santa Barbara, Calif., Jan. 31, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I have had your No. 00 Hover going with 75 chicks and every chick is healthy and growing fine.

H. E. Parker.

Brooklyn, N. Y., Jan. 31, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I bought one of your Hovers and will get another one in the near future.

H. Mormile.

Altamont, S. D., Jan. 29, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I purchased an incubator and Hover from you last year and had fine success.

Michael Fischer.

Wellington, Tex., Feb. 4, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—Have purchased me another one of your Hovers since I wrote you last. My wife's father has a 52-inch. We have chickens in ours. We think they are fine.

S. P. Phipps, R. R. No. 3.

Salem, Ore., Feb. 21, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I bought one of your Hovers last year and like it just fine.

Mrs. Robert Beer, R. No. 9, Box No. 90.

Holland, Mich., Feb. 21, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—You can use our name as a successful user of the Reliable Blue Flame Wickless Oil Heated Colony Hovers, we are,

Yours very truly,

Macatawa White Leghorn Co., Inc.

Jonesboro, Tenn., March 1, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I have had good success with one of your incubators, hatching 80 percent of fertile eggs, it being the first time I have operated one.

J. E. Edwards, R. No. 1.

Windsor, Wis., May 3, 1921.

Reliable Incubator and Brooder Co.,

I got a Reliable Blue Flame Oil-Heater Colony Hover, and like it fine. So please send me as quick as possible a 42-inch Reliable Blue Flame Oil Heated Colony Hover C. O. D. as I need it at once.

R. L. Roske.

Agricultural and Mechanical College of Texas.

W. B. Bizzell, President.

Poultry Husbandry. College Station, Tex.

T. J. Conway, Associate Professor.

March 12, 1921.

Reliable Incubator and Brooder Co.,

Attention Mr. J. W. Myers.

Gentlemen:—We have recently purchased some of your "Oil Burning Brooders" for this season, and are very well pleased with same and will place an order with you in the fall for one more dozen. Yours very truly,

T. J. Conway.

Bostwick, Fla., Jan. 6, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I have four 42-inch Wickless Oil Burning Brooders and am well pleased with them, and am in the market for thirteen more of them.

H. E. Bunker.

Oakland, Calif., Jan. 6, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I bought one of your Reliable Hovers about one year ago and have had such success with it that I have recommended to my friends.

Joseph Ziebolz, 2334 Fruitvale Ave.

Clinton, Ind., April 4, 1920.

Reliable Incubator and Brooder Co.,

Gentlemen:—Received the Hover on March 30 and find it O. K. You could not get it back for what I gave for it. I cannot get along without it.

R. D. Bledsoe.

Forsyth, Montana, Feb. 25, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—The Hovers which I purchased from you last fall is just what I have been looking for. I shall be in the market for several of them next fall.

Chester J. Nertney.

Fayetteville, Ark., March 19, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—The Brooder which you shipped to the University arrived in good order and I have it set up and working at the present time. The chicks are doing exceptionally well and never appear to be chilled. I like the construction of the brooder and find that it requires very little care. I find that it is easily regulated and does not throw off any fumes. The chicks that I have in this brooder are doing much better than the ones I had in the same house with a Coal Burning Brooder last year, and assure you that I shall do justice to your brooder whenever I have any inquiries concerning the brooding of chicks.

S. R. Stuet.

Richmond, Ind., Feb. 9, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—As I have my incubator set, my brooder is the Blue Flame Reliable I bought from you last year, it is O. K.

James S. Tierman.

Kinston, N. C., Jan. 22, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—Last year I bought one of your Hovers and it worked fine.

H. L. Fleming, Kinston, N. C.

St. Petersburg, Fla., Jan. 31, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—Your Hover arrived in due time and is now mothering 140 Baby Chicks to perfection.

Geo. H. Frush.

Portsmouth, Va., Jan. 1, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I certainly am pleased with my little Baby Grand Incubator. My first time and experience of running and I tried 30 of the Rhode Island Reds and I got 28 fine chicks from them so you know I must be pleased. I did not have any trouble with the machine.

Mrs. J. Robertson.

Tampa, Fla., Feb. 6, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I have two of your Reliable Standard Blue Flame Brooders, 52-inch, they are sure fine and I intend to install 12 more as soon as I get rid of some other makes I have.

Weills Grand View Egg Farm, Mineral Theigh Way.

Vinita, Okla., Feb. 23, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—Have four 220 egg machines, they run very accurate

W. L. Gross.

Warsaw, Ind., Jan. 17, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I purchased a 250 egg Reliable, and have such splendid success with it.

E. F. Van Osdol.

Fairfield, Conn., May 14, 1920.

Reliable Incubator and Brooder Co.,

Gentlemen:—I had great success running your incubators, have had 180 chicks from 210 eggs.

Mrs. Wm. S. Fallon,

Wakeman Road, R. R. No. 6,

McAlisterville, Pa., Feb. 2, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—Have been having good success with my Reliable machines.

R. D. Long, R. F. D. No. 2.

Alexander, Ind., Jan. 4, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I have one incubator that holds 100 eggs I would not part with. I know I can depend on it.

Mrs. William Maynard.

Edwardsville, Ill., Feb. 6, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—I have one of your 60 egg Reliable Incubators, I bought it in 1905 and it is as good as then.

Mr. J. A. Draper.

Malboro, Mass., Feb. 14, 1921.

Reliable Incubator and Brooder Co.,

Gentlemen:—Twenty years ago I got a Reliable Incubator and brooder from you and was very much pleased with them.

I. A. Gelina, 4 Forest St.

Lady Hollywood II. Official Record 315 Eggs in 365 Days.

World's Record Layer, 336 Eggs in 365 Days, Record 307 Eggs. Mother Second Hen Vineland and Best Leghorn Storrs.

Eggs For Hatching—THE VERY BEST—Eggs For Hatching

We have mated over 1,000 hens with 365-day trap-nest records of 200 to 336 eggs, to males from dams with trap-nest records of 250 to 323 eggs. These matings are rich in the blood of our Egg Laying Contest Winners at Missouri, Connecticut, New Jersey, Delaware, Kansas, California and Washington Egg Laying Contests.

We believe we are offering hatching eggs from the best flock of high average egg producers in America, if not in the world. Correspondence invited.

PROF. T. E. QUISENBERRY

I Guarantee Less Chick Loss or Money Back

How You Can Hatch Every Fertile Egg Prevent Bowel Trouble and Chick Loss

The secrets of successful chick hatching and raising are now available to everybody who wants them.

I show you simple methods that are necessary to insure your success in hatching chicks without loss. I show how to prevent dead chicks in the shell; how to produce more fertile eggs, stronger germs, and how to hatch stronger chicks, etc., etc. You should know When and What to feed baby chicks from their first feed to maturity—how to prevent chick death from bowel trouble or White Diarrhea; how to Avoid Improper Brooding and Feeding Methods.

MY GUARANTEE! I guarantee bigger hatches and to practically eliminate dead chicks in the shell and chick loss from bowel trouble or White Diarrhea.

Why Run the Risk of Failure

Millions of dollars are lost annually by feeding grains which produce flesh on little chicks without developing proper growth of bone, body and feathers. The result is weak, stunted chicks, easy prey for lice, mites or hot weather. Their digestive system soon breaks down—then you either burn or bury them. They are a dead loss! Every baby chick brought to laying maturity, or ready for market, is a possible profit producer. My Free Book shows, in a simple, easy-to-understand way, how to make the money you ought to make and how to avoid the loss that you must avoid to enjoy biggest and quickest profits.

Big Money Raising Poultry--But You Must Know How

Thousands and thousands are making more money from poultry today than ever before, but thousands are failing and losing money in the business too. Why? Because they lack a knowledge of simple practical methods that have brought success to other thousands. My experience as a poultry farmer has brought me into contact with both the successful and unsuccessful. If you get into the business, or continue in the business of poultry raising without knowing the many pitfalls and how to avoid them, the chances are about 100 to 1, of losing money, labor and time. There is only one way of enjoying the full measure of success with poultry and that is to have a thorough knowledge of the basic principles as outlined in our Free Book, which I will be glad to mail you.

No Matter Where You Live or How Many You Raise!

Every farmer and every city lot poultry raiser, every man and woman, every boy and girl, regardless of the climate they live in, can make their poultry more profitable if they use the correct methods which are so easy to learn. Whether you have one dozen chickens or a big flock, my Free Book on Poultry Raising, will open the way to success, and I positively guarantee that you will hatch and raise more chicks and make more profit.

Saved Practically All Loss

After studying your method of feeding and housing layers and breeders, also hatching and brooding and feeding chicks, I hatched 271 chicks February 17th and raised to maturity 252, including 128 cockerels and 124 pullets.—Clyde Smith, Illinois.

Greater Success Than Ever

Have studied your books and gotten much good out of them. This year have had better success with my young chickens than ever.—L. B. Vincent, Fla.

100% Hatched—Raised All But One—this is the record of Mrs. Geo. Ewing of Indiana, after following the simple practical instructions I gave her. Mrs. Ewing is only one of thousands who have written to me, telling of their success through my methods.

Made \$2.75 Profit in 7 Months

My last year's pullets have made me \$2.75 each, over and above the feed cost since December 1, and up to June 1, 1919, in eggs at store prices, thanks to your simple methods.—Axel Carlson, Minn.

Free Book—Send No Money!

Send No Money!—Just use the coupon below and write your name and address. Mail the coupon today and I will send you Free and without obligation on your part, my New 96-Page Book which tells "How to Avoid Poor Hatches and Bowel Trouble in Baby Chicks." Gives methods successfully used in feeding for fertile eggs and successfully hatching, brooding and raising thousands of baby chicks.

BYERS' ORPINGTONS

FIRST AND CHAMPION BUFF ORPINGTON ADULT PEN COCK
CHICAGO COLISEUM, DECEMBER, 1918
BRED AND OWNED BY C. S. BYERS, HAZELRIGG, IND.

FIRST AND CHAMPION WHITE ORPINGTON COCK
CHICAGO COLISEUM, DECEMBER, 1919
BRED AND OWNED BY C. S. BYERS, HAZELRIGG, IND.

FIRST BLACK ORPINGTON ADULT PEN COCK
CHICAGO COLISEUM, DECEMBER, 1919
BRED AND OWNED BY C. S. BYERS, HAZELRIGG, IND.

AT CHICAGO COLISEUM past 29 months—75 of my Orpingtons stood under First Prize Ribbons (all competitors combined showed but 16 birds under First Prize Ribbons) and in Buffs this winter I showed 11 birds under First Prize Ribbons while all my Buff competitors showed but three Buffs under First Prize Ribbons—172 of my Orpingtons stood under Ribbons. I won 13 out of a possible 14 Firsts on Pens and never lost a Special for Best Display in Buffs, Whites or Blacks at this premier exhibition, Chicago Coliseum during the past 29 months.

My Champion Exhibition Matings of 1921 include these sensational winners and represent \$30,000 breeding value. My continuous, constructive Orpington breeding for 20 years is the key. Nowhere else in North America can you purchase or find Buff, White or Black Orpingtons that excel these in Standard exhibition excellence, perfection of mating and the "metal" that insures high fertility and heavy egg production. Why

not buy eggs that make good AFTER the ad is read and the order placed.

EGGS From CHAMPION EXHIBITION MATINGS—\$15 per 15, \$28 per 30, \$45 per 50, \$85 per 100. From SPECIAL MATINGS OF CHAMPION BLOOD—\$5 per 15, \$9 per 30, \$14 per 50, \$25 per 100. All egg shipments prepaid and all infertile eggs replaced free.

WHITE ROCKS—Champion General-Purpose Fowls

For beauty—White Rocks. For finest table poultry—White Rocks. For lots of big brown eggs—White Rocks. Possessing these three valuable characteristics in unusual degree, as well as great vigor and hardiness, White Rocks are justly entitled to the proud claim of "champions." And

Wilburtha White Rocks Are Supreme

At Wilburtha you will find the choicest specimens of this great breed. Not a few birds only, but hundreds of them, all possessed of real quality.

The quality of our exhibition White Rocks is shown by our consistent winnings at America's greatest shows. At the last Madison Square Garden Show we won 2-4-5 cock; 1-2 cockerel; 1-5 hen; 2-3-5 pullets; 1-2-3-4 old pen; 1-3-4-5 young pen. Fifty birds under ribbons.

They are great layers, too. Our famous hen, "Prolific Queen" laid 301 eggs in one year at Vineland Laying Contest. Her sons and grandsons head many of our pens.

For years Wilburtha has been headquarters for superior White Rocks and we have always been unable to supply the demand. So we recently purchased the entire White Rock flock of Owen Farms and this season hope to meet all demands promptly.

We have mated for your selection twenty-nine special breeding pens. In addition we have over 800 breeders on free range from which we offer hatching eggs and baby chicks by the hundred.

Be sure to get our mating list. Mailed free on request. And remember—in addition to White Rocks we breed S. C. White Leghorns, Jersey Black Giants and S. C. Rhode Island Reds. Good ones.

Owen Farms

S. C. RHODE ISLAND REDS and BUFF ORPINGTONS

Stand Pre-eminent

Year after year they have won for Owen Farms' customers at nearly every show of importance all over the United States, Canada and abroad. As layers they have passed the 300 egg mark in the trapnests of customers. Many of the leading flocks of S. C. Reds and nearly all the leading flocks of Buff Orpingtons were started with Owen Farms blood lines.

1921 Matings

are far and away the strongest I ever made. My 72-page mating list gives a careful description of thirty matings in Reds and twenty in Buffs. It gives a good general description of my fine group four matings; an historical sketch of the development of my flocks; prices on stock and eggs for hatching and my general guarantees. It is yours for the asking. You owe it to yourself to read this list from cover to cover before you make your decision as to where you will buy.

The ten males pictured on this page are heading ten of my matings. Each can be identified by the number of the Pen. Only wish space would permit me to show you more of the superbly typed males heading my pens. If you could come here yourself, see the magnificent type and the rich, dark, sound and even color right through my Red matings and the smooth, even golden buff color right through my Buff matings, you would be as puzzled as other visitors have been to select the pen or pens you really felt would produce the best youngsters.

1921 Prices

Group 1.—Eight Red and four Buff Matings comprise this group at \$25.00 for 15 eggs.

Group 2.—Ten Red and six Buff matings comprise this group at \$18.00 for 15; \$35.00 for 30; \$50.00 for 50 and \$90.00 for 100.

Group 3.—Twelve Red and ten Buff matings comprise this group at \$12.00 for 15; \$22.50 for 30; \$35.00 for 50 and \$60.00 for 100.

Combined sittings from groups 2 and 3 are \$15.00 for 15; \$29.00 for 30; \$42.50 for 50 and \$75.00 for 100.

Group 4.—Thirty Red and twenty Buff matings comprise this group at \$6.00 for 15; \$17.50 for 30; \$30.00 for 50. The matings are all small and choice with seven to ten females in each pen. Each female placed with the proper male to make her a real producer.

Results You Can Expect

From an investment in Owen Farms eggs for hatching. Thousands of fine chicks are grown each year all over the country from eggs produced by Owen Farm matings. Hundreds of these youngsters develop into winning birds in customers' hands. Other hundreds develop into star breeders. My egg customers grow many more fine chicks each year from Owen Farms' eggs than I do; my only advantage being that here I have thousands in one flock. When you buy your eggs here you share with me the chance of producing the best bird of the year. Your average quality will be very fine. If you want a choice flock of real quality birds that will win and breed winners; lay, and pay you can secure them at a minimum cost from Owen Farms' eggs. Send your order directly from this advertisement and book your date. You can specify pens, if you wish, after mating list reaches you.

"Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism. Send me your order and learn what real golden rule treatment means as applied to the poultry business.

HOW TO PREVENT CHICK LOSSES

Losses From Accident—Crowding and Smothering—Diarrhea is Sometimes Only a Symptom of Other Trouble—Leg Weakness and Gapes—Head Lice and Mites.

By T. S. Townsley

ONE serious drain upon the poultry keeper's profits is the annual heavy loss of baby chicks. Few reliable figures are available to show how heavy this chick loss is but investigators place the figure at anywhere from a fourth to a half of all the chicks hatched. Every chick that dies represents at least two eggs wasted besides a considerable outlay of labor and incubating expenses.

Few hatcheries are offering chicks at less than twenty cents apiece this year, and it is probably safe to assume that every dead chick represents a direct monetary loss of approximately twenty cents to the owner, to say nothing of the reduced earning power of the flock for the next year on account of the inability to raise as many chicks as were needed.

While it is scarcely ever possible to raise every chick hatched even under most favorable conditions, it is an undeniable fact that many of the heavy chick losses are preventable. The causes of chick losses can generally be classified under the two headings: accident and diseases. The more common causes of accidental death are drowning, suffocation, and the attacks of rats and other predatory animals. "Safety first" is the proper procedure in reducing these accidental losses. Drowning takes a particularly heavy toll where the chicks are brooded with hens on account of the fact that the hens often fail to take the chicks to a safe place when a storm breaks.

Brooder chicks are much less likely to drown than those with hens if the brooder door is left open, because at the first sign of rain the chicks without a mother usually make a break for their accustomed shelter. With hen-hatched chicks the loss from drowning can be materially reduced by keeping the hen confined during the brooding period so that she cannot wander away from shelter, and if the hen is in her coop the chicks are quite certain to find their way in before the storm does any damage.

Suffocation is usually due to improper temperatures in the brooding quarters. With some of the poorly constructed brooders fire is an ever present menace and takes a heavy toll of baby chicks each year. Equally serious in artificial brooding is the matter of having the fire go out because this leads to the chicks crowding together for warmth and piling up, with the result that those on the bottom are smothered. In the oil-burning brooders a lack of ventilation sometimes results in the chicks being suffocated by the fumes from the lamp. During the later spring months chicks are sometimes suffocated by being confined in a lot where no shade is available, giving the sun a chance to shine directly on the unprotected bodies of the chicks. Good brooders, with provision for shade during hot weather, will largely eliminate losses from suffocation.

The havoc caused by rats and other animals plays a considerable part in the chick losses especially among the farm flocks. It is not an uncommon thing for rats to kill as many as fifty chicks in one night when they get started. Most of the predatory animal losses can be stopped by providing brooding quarters that are rat proof. The depredations of cats and chicken-eating hogs are best controlled by dispensing with the cat and keeping the chickens away from the hog pens.

Not all chick diseases are readily preventable but there are certain classes of ailments which annually cause heavy losses that can be almost entirely eliminated by proper care. The vitality of the chick is of fundamental importance in solving the disease problem and the sooner the poultry keepers realize the futility of trying to brood the weaklings in the flock the sooner the disease problem will cease to threaten the poultry keeper's prosperity.

Strict observance of the rule to kill all weak chicks at the beginning of the brooding period will go a long way toward preventing many of the common diseases. Proper brooding conditions also play an important part in disease control. On hundreds of farms the stove brooder has solved the problem of furnishing the right conditions of heat, ventilation and exercise for the baby chicks, and has gone a long way to eliminate chick losses.

A large percent of the baby chick mortality occurs within the first ten days and the cause of death is usually listed as diarrhea. While there is undeniably a highly infectious and decidedly fatal disease commonly called contagious white diarrhea, which is caused by a specific disease germ, practical experience indicates that a large percent of the diarrhea losses result from other causes instead of this particular germ, and in many cases the diarrhea is a symptom of the disease rather than the specific cause of death.

It is a well known fact that allowing the chicks to become chilled during the early part of the brooding period will result in digestive disorders accompanied by a diarrhea which frequently causes death. That this is preventable is shown by the numerous cases of flock owners who have witnessed the complete disappearance of this trouble when suitable brooding temperatures were maintained. Improper feeding also favors the development of diarrhea-like diseases, and especially overfeeding during the first two or three days of the brooding period or starting to feed before the chick is able to digest the food. Following the rule to give the chicks no feed until they are at least two days old, and then to feed little and often during the first week goes far to reduce mortality and digestive troubles during the early brooding period.

One cause of serious loss in brooder chicks, especially during the early spring, is the

(Continued on page 479)

DEVELOPING A BUSINESS IN BABY CHICKS

How Mrs. Bundy, of New Mexico, Built Up a Prosperous Business for Herself—Something New for a Country In Which Poultry as an Industry is Something New.

By E. L. Haden

SIX years ago Mrs. H. V. Bundy of New Mexico started in the baby chick business, her equipment being a cheap incubator and no capital. Today her plant is valued at \$15,000. Four years ago at the end of the season she had \$45. Last year her gross receipts were \$12,000.

Profits in poultry!

Many people consider poultry a gamble, but money in the bank tells a true story. Mrs. Bundy did not go into business without experience. She is a pioneer incubator user, having bought her first machine twenty-two years ago. If a successful beginning foretells a successful future her destiny was written twenty-two years ago. On her first attempt she had a 100 percent hatch and raised every chicken. This is the only 100 percent hatch she has ever had, the next best thing being 92 percent—138 chicks from 150 eggs. She averages 62 percent—which will appear low to most readers, but considering the climate it is good, as the general average in this section of the country is below 50 percent.

Overcame Great Difficulties.

Mrs. Bundy is the type of woman who wants to help—from the beginning of her married life she has always had a flock of hens, selling eggs, fryers and roasters for pin money. Eleven years ago the family moved to the Mesilla Valley, New Mexico. You may be sure her incubator came along with the furniture. The Mesilla Valley is a desert country 4,000 feet high. It has since come under the Elephant Butte irrigation project that has turned the desert into a garden and filled the valley with prosperous ranchers. Water on the ground, however, has not affected the dry arid atmosphere. Through experiments Mrs. Bundy proved two vital factors for successful hatching in this climate. First, owing to the great variation in temperature—warm days and bitter cold nights—good results could only be obtained in a cellar. Second, no incubator manufactured furnished enough moisture for hatching in this dry desert air.

She set about adapting her incubator to the peculiar needs of the country and from the first hatched plenty of chickens. Almost all the women of the valley, being an ambitious, industrious class of people, had tried, usually with poor success, to make a little extra money with chickens. Many incubators were stored away collecting dust in odd corners. These observing ranchers began to notice that while they failed Mrs. Bundy always had a good flock, that when she put eggs in the incubator she got a fair number of chickens. There are numbers of cases on record where an incubator failed to hatch a single chicken. Most of the ranchers had become discouraged and decided incubators could not be used in the desert.

Desperate neighbors, seeing summer approach and they didn't have a chick, began asking Mrs. Bundy as a favor to let them have a few baby chicks. They always got the chickens. Mrs. Bundy is like that. All of this was done in a neighborly spirit of helpfulness rather than personal profit. The logical development of this circumstance was the building up of a business in baby chicks and commercial hatching. The demand grew and grew. She bargained for the unused incubators in the neighborhood. Some she bought, but as she had no money many times she took some of them on shares. A few of these partnerships were profitable, but many were not. This was six years ago. From that day her plant has never been able to grow as fast as her orders.

Fortunately, the house in which she lives has a full size basement, which soon took on the appearance of a museum exhibit of incubators. There were twenty-seven incubators representing about every kind manufactured. During the first two years Mrs. Bundy served the community much better than she served herself. She accumulated very little money

except what she put into additional equipment, which increased in value from \$23.50 to \$178.20 in one year. She attempted to please everybody. Regardless of the breed of chickens a customer wanted she could be counted on to get the necessary eggs somewhere. Not only chickens, but also turkeys, geese, ducks, guineas were hatched.

The work involved in running twenty-seven incubators, many unreliable, was overwhelming. Lamps to fill, wicks to trim, thermometers and hydrometers to adjust. Each incubator was fitted with a shallow tray of sand kept moist as the hydrometer required. This was the secret of success—only it was an open secret. The temperature dropped so low at night that the lamps had to be readjusted in the middle of the night. The work did not discourage her. Mrs. Bundy is a canny woman. Even though she had only accumulated \$45 in two years of hard work she sensed the possibilities of the business with proper facilities. She succeeded in borrowing \$100, after much embarrassing difficulty, which she added to her \$45 and bought a coal-burning incubator of 600-egg capacity. Next she had a housecleaning, eliminating all the partnerships, reserving the good machines, junking the old unreliable ones. A number of the ranchers felt sufficient confidence to take back their machines and to try again. By using the system of moisture most of them succeeded.

Tries a Mammoth Incubator.

During the next season, 1917, she hatched 10,000 chicks and her real business career began. The coal-burning machine proved so profitable that the next season 1,200 more egg-capacity was added. By 1919 the business had reached such a degree of permanence, and the profits had reached a sufficient amount, to enable her to build a specially constructed concrete incubator house and install two coal-burning incubators with a total capacity of 6,000.

The cement floor is so constructed that the machines set in a 3-inch depression which is kept filled with water to furnish moisture. Ventilation is supplied by small windows near the ceiling fitted with muslin-covered frames. Adjoining the incubator room is the brooder room fitted with a coal-burning hover of 2,000 capacity. The south front of the room has glass windows hinged so that fresh air can be admitted when wanted.

The room opens into a specially fenced yard so the baby chicks can get out of doors without any work. The business had now grown so that it wasn't practical for Mrs. Bundy to give her time to the various small incubators. She sold all of them off and installed in the house basement seven oil-burning incubators of 600-egg capacity each. This made her total capacity 10,200. She has been unable to increase the capacity since then on account of her egg supply.

In 1920 the profits bought the five-acre ranch that had been rented so many years. To call the place a ranch is rather an inaccuracy because it is in the town limits, a very great convenience during the shipping season. A great deal of money has been spent in making the place into a chicken ranch. Several hundred dollars worth of fences and a thousand dollars in modern open front chicken houses, but Mrs. Bundy has only begun. As from the beginning she is planning to improve the place as she makes the money.

Establishes Breeding Operations to Supply Her Own Eggs.

Early in her career Mrs. Bundy realized that the greatest handicap was the lack of an adequate egg supply. Commercial hatching offered the greatest annoyance and least profits. Few people took the right care of their eggs before bringing them to the hatchery, or their flocks were in poor condition, but poor hatches and weak, puny

THE SILVER LACED WYANDOTTE

One of the First of the American Breeds—The Forerunner of the Wyandotte Family—Second Cockerel at Recent New York Show Was Sired by First Cock—Fifth Pullet Was Produced by Same Mating. *By R. G. Williams*

THE breeding and showing of Silver Wyandottes has been my pleasure for more than twenty-five years. I made my first start with the breed in 1893, and since that date have tried to mate wisely that each season's chickens might show some progress. I feel that, although some years the progress has been slight, on the whole the gain has been marked.

As I look back over the years I feel that I can note certain marked changes in the breeding and in the showing of Silver Wyandottes.

The decidedly increased interest in Silvers, even during the war, and since, is as marked as that in any breed in the American Standard, with perhaps two or three exceptions. Why should the Silver Wyandotte not grow in popular favor? It is the beauty breed, the birds are superior layers, especially tasty as dressed poultry, and both old and young are hardy. In laying contests they have invariably held their own. Away out in Australia, I am informed, they are one of the popular breeds. We all know the popularity of Silver Wynadottes in England.

Some Early History.

It may be of interest to note in passing that Silver Wyandottes were originated in America and were the original Wyandottes. The breed was admitted to the Standard at Worcester, Mass., in 1883, a city only twenty-five miles from my home.

Fred A. Houdlette of Boston gave the name to the breed. In later years he became a personal friend of mine, and just a few months before he died I purchased, at his request, all of his Silvers. I have in my possession some of his old-time cuts, both of birds and their feathers.

A bit of the above is written to show how fortunate I have been in being in close touch with Silver Wyandotte atmosphere from the pioneer days of the variety.

The breeding of this beautiful and useful variety of Wyandottes is a most interesting study, and it is no harder job to obtain a Madison Square Garden or Boston winner in Silvers than in many of the so-called "more popular" breeds.

There are two methods in vogue in the breeding of Silver Wyandottes: single mating and double mating. The single mating idea is that a male and females be mated together for

Silver Laced Wyandotte cockerels. The male to the left is a high stationed bird, long in neck, high in tail, flat in breast. The cockerel to the right has good Wyandotte type: nice back, well carried tail, and rounded breast.

the purpose of producing a satisfactory percentage of both cockerels and pullets that possess high-class Standard requirements. The double mating plan is that male and females shall be selected and so matched that the offspring of one sex will predominate, not in numbers but in Standard quality.

Both systems have their strong points and both have their supporters. Slowly but surely the double mating system has been creeping in until today there are many advocates of double mating east and west. It is stated on good authority that breeders of solid colored birds are using double mating to obtain desired results as to shape.

Personal experience and the conclusions I have arrived at is all that I have a right to try to tell about. For years I have mated my several pens with the expectation that from each mating I would get a percentage of good males. I do that today. For illustration, my first New York cock this year was the sire of the second cockerel and fifth pullet at the same show.

Now Employs Double Mating.

In my experience of some five years with the so-called double mating, I have come to the conclusion that I can obtain more nice pullets by mating females with a certain male and forgetting about the results as far as the quality of the cockerels produced is concerned. I find that many other breeders, like myself, have worked along these lines of making a special mating for pullets.

It would seem that in the progress for better Silvers during the past ten years by far the greater improvement has been in the females. And by double mating, my experience of the past two years has been most pleasing as to the issue of both sexes.

Up to last year, in my practice of double mating, I had been using males that I had obtained here in the United States. Last spring I imported a cockerel and pullet through the efforts of John C. Jodrey, who for many years was recognized as one of America's foremost breeders of Silver Wyandottes. Mr. Jodrey now lives in London and through his efforts, one Philipson, said by many to be the best breeder in England, (Continued on page 483)

Silver Laced Wyandotte pullets. The pullet to the right shows the open, oval lacing that has been secured in the best American birds through the introduction of English blood. The pullet to the left has smaller individual feathers and a heavier edging of black around each feather.

HANDLING THE BACK YARD FLOCK

The Birds are Tended Without Entering the House—An Office Man Outlines His Methods of Caring for a Small Flock—Leghorns Especially Recommended for Close Confinement.

By Alfred B. Garner

THIS article is written by a back-lot poultry keeper who has made a success of the business since he was fourteen years of age—thirty-three years ago. It is written *only* for back-lotters. And it is especially written for those back-lotters whose work takes them away from home during the day, allowing them for the poultry end of the business but about half an hour early in the morning and about the same in the evening. It does not pretend to teach anything to the large poultry raiser nor to those who have help at hand to tend the stock at any hour of the day.

The writer can honestly state that if the following directions are fully carried out in their entirety, a man on a city back-lot with a space of six by eighteen feet at his disposal, can, with less than an hour's work a day, not only provide, free of all charge, all the eggs his own family will use, but also sell enough to make a profit on the side. And such eggs!—not the eggs of hens that receive most of their food from the offals of the street or the soured oats of the manure pen; but sweet, fresh eggs of the pure grain fed chickens, flavored with the celery tops, the waste salad leaves, and other delicacies of the table.

The success of back-lot poultry keeping lies in the poultry house, the feed, the chickens, and the care given the stock. In my judgment, backed by over thirty years of success in this line, the importance of these four items lies in the order they are given. In hoping for success, remember that if one of the four items is lacking you might as well not have the other three—success will not follow. You must use all four items at one and the same time for best results.

The Poultry House.

I read nearly all the poultry magazines. One advocates a house of one character as ideal; another has a different idea. But it is very rarely that you see an article in reference to a poultry house strictly suitable for a back-lotter. Most of the houses advised are too big for a city back-lot. If such a one were used, no room would remain for the clothesline and the hundred and one other things necessary around a house. Very few advocate a two-story house, and yet with a two-story house you have just double the space for the chickens on the same piece of ground.

Nearly every description deals with a poultry house where the poultry raiser tends to the chicks from *inside* the house. This makes it necessary to have the house high enough and big enough to not only contain the chickens but the man as well. To have it this big means wasted space to fill with cold air in winter; no disinfecting sunlight at the far corners; difficult to clean, and therefore very rarely, if ever, thoroughly cleaned. And all this works against success.

In my thirty-three years' experience I have owned and built many different styles of poultry coops. I want to tell you what I consider the ideal poultry coop for back-lotters. I did not make the first one of these coops myself, but bought

it ready-made—a portable house. I hold no brief for the manufacturer and am not his agent, by any means, but the house is so good that I hope the editor will pass it along so others who may be starting up may have the benefit of my experience.

The house I consider ideal is a two-story house, 5 feet wide and 8 feet long, and with a wire runway at the end, 5 feet wide and 10 feet in length. In this house I keep fifteen hens and a male. This year has not been very cold, so that I may show you the success that may be had in a house of this kind I will go back to the record of 1919-1920, which was a severe winter. In Harrisburg the Susquehanna river was frozen from bank to bank the entire winter. On ice dams the ice was over 18 inches thick. During the entire winter the sun shone not over half a dozen days at most. Yet my

pen of fifteen hens averaged over nineteen eggs a month per bird during all that bitter weather—and I would like to know who had a better record?

The front of the second story of this house is practically all glass with the exception of the muslin ventilating windows at the top. The entire second story front consists of two glass doors with the muslin ventilators above. These two doors are themselves hinged into larger doors covered with wire netting, so that with mild weather the entire front can be thrown open, the wire netting doors keeping the chickens inside the house. In cold or stormy weather, the big glass doors are closed and the muslin ventilating windows above the glass doors furnish a plentiful supply of pure, fresh air.

The nests are the closed in front type which the chickens enter from the rear. They are made in the form of drawers placed in the nest frame. The front of the frame has a wooden flap that closed makes the nests dark, and which is opened to draw out the nest boxes and remove the eggs. The darkened nests prevent the formation of egg-eating habits. Over the nests are the roosts, the top of the nests forming the droppings-board.

In this second story are also the dry mash hoppers, hoppers for grit, charcoal and oyster shells; the water fountain, and the green food rack. All are fastened to the walls, out of the way. In the center of the floor, toward the front of the house, is the trapdoor leading to the scratching floor below.

The back wall and the two ends, as far as the droppings-board extends, are winter-protected—that is, double-boarded, with an air space and fiber board between. This prevents all draughts and dampness and forms a warm, cozy spot for the roosting hens. Attached to the roof ceiling by hinges is a muslin covered frame the full length of the house, and which, when lowered, extends to slightly below the top of the droppings-board and standing about two inches away from the outer rim of the droppings-board. On very cold, blustery nights this frame is dropped in front of the hens after they are on the roost. Enough air circulates from the

Mr. Garner's back-yard poultry house and run for chickens. This house is tended from the outside.

2-inch space below to furnish plenty of fresh air, and yet the heat of the hens' bodies themselves warms up this roosting space within.

The lower floor is entirely the scratching apartment. This I have covered eight inches deep with O. K. poultry litter. Again, I wish to state I am no salesman, but I know a good thing when I see it, and O. K. is certainly such. I have used it for as long as five years at a time without changing the litter, and in all those five years of continual use it absorbed every odor, all the droppings, and harbored no lice or mites.

Advantages of the House.

Now, I want to call your attention to several points in the above description, that you may not fail to see the full meaning and advantages they give, but which I assure you helps to mean success and lessened work. In the first place, from the glass front door of the second story to the most distant point in the coop is but five feet. This means that in the winter, when sunshine is a blessing to the poultry business, any sun that shines will bathe and warm up and disinfect every single inch of that coop. Not only will it disinfect, but I say will warm up the coop.

Can you say as much for your big coops? And the big glass doors will attract every bit of heat from the light, even though the sun is not shining in all its glory. Again I refer to the bitter winter of 1919-1920. How many of you, with your big, man-entering coops, had frozen water fountains and left the hens to suffer? And yet, during all that bitter winter I only lit my little water fountain heater three times in the entire winter—and the water in the fountain was never frozen.

Another point: In the mornings I do not have the time to come downstairs in old clothes to tend the chickens and then change to my office clothes. Again, I might ask the advocates of the big coop where the owner must enter the pen itself to do the work, how clean can you keep your clothing for any length of time in among the fluttering hens and rubbing against the dust covered walls? Also, I call your attention to the fact that the furthestmost point from the glass doors is but five feet and to the hoppers and water fountain but one foot. I stand outside my coop on the clean boardwalk; with a short handled garden hoe, from the outside, I daily scrape off the dropping board into a dust pan; I renew the water; tend to the feed hoppers; and am as clean as when I started.

Space is of vital importance in a city back lot; likewise exercise for the chickens is a vital necessity if we expect to get eggs. There is where the two-story house comes in. It not only gives me the double space for the chickens on the same piece of ground but the hens are up and down that stairway hundreds of times a day—and there is the exercise. I kill two birds with one stone.

From the above description you might imagine that the house was so ideal that no one could find fault with it. Right after I purchased mine, the manufacturer issued a new catalog and I was shocked to find him running down his own No. 4½ house that was my pride, and recommending a new style of house he had started to manufacture. He asks: "Why tend your chickens in the rain or get down on your knees to fix the litter?" or words to that effect. Then he goes on to explain that in his new two-story house it is big enough to enter yourself to feed and care for the flock and mix up the grain in the litter without bother. And just there is where the manufacturer and I must disagree. He has added to the width and height and by just so much has he taken away the sunlight and the warmth. He lets you enter

the coop and get your clothes all dust and dirt—something entirely unnecessary. I am glad that he has not discontinued making my type of house.

He is right about one fault of this outside tended house—the rain or snow. But in the several years I have had this new house I can recollect of but eight or ten times when I needed an umbrella to tend the chickens. Compare this to the 365 times a year you are dirtying and fouling your clothing in the coops you enter. And recollect, you have lost sunshine and warmth—vital necessities.

All in all, a house built on the order of this one is the ideal back-lot poultry house. Not too wide—five feet the most—plenty of sunlight and plenty of warmth that makes the hens lay.

The house, as it comes, has but two wire screen covered windows in the front of the scratching floor. To keep out the rain and snow from beating in in winter, I made two glass window frames to fit the openings. I fasten these on in winter so the bottom of the frames stand out from the coop about five or six inches so as not to detract from the fresh air feature of the coop. These are used only in the winter and taken off and stored in the summer.

Feed for the Back Yard Flock.

I feed commercial mash of the best grade; ready mixed grains of the best commercial grade, sprouted oats, and the kitchen and table scraps.

As I do not reach home from the office until very nearly time for the chickens to roost, I have no time to feed the grain portion of the ration in the litter at night that is advisable. So for the grain portion of the feed I prepare the night before. For the fifteen Leghorn hens and the rooster I use a quart and a scant pint of the mixed scratching grains. After the chickens are on the roost, and through the little trap door I spread the grain as evenly over the litter as I can. Then with the garden hoe scratch the litter over it from the side the chickens have thrown the litter in the day until all grain is deeply

hidden. That is ready for them the first thing in the morning. Next, if it is cold or blustery I close the trap door, lower the winter protector canvas curtain, empty the water fountain, shake down the mash hopper well so it is full, lock the doors and, all in ten minutes, have them snug for the night.

I add to the dry mash, as it comes from the manufacturer, one-fifth of the quantity of mash used of best 80 percent protein meat meal and one-fifth of the quantity of mash used of dried buttermilk. This sounds expensive, but it is not so when you add up the results.

At 5, a. m. I turn on the electric lights in the pen after filling the water fountain. I have read many times about plants that also turn the lights on at night but, although I have used the lights ever since the idea first came out, in all my experience I have never found one of my chickens that will stay off the roost after their regular roosting hour, lights or no lights. But at the first flash of light in the morning they are off the roost busy eating and singing.

Electric light sounds costly, doesn't it? And yet I, who never had any experience at all in the electric line, for a few dollars invested in a five and ten-cent store, bought enough material to run the line from my kitchen and light up both floors of the pen, and did the work myself. I use a 4-candle power light both upstairs and downstairs. You hardly notice it on your electric light bill at all. It pays and pays well; I judging about 33⅓ percent.

HATCHING CHICKS WITH BROODY HENS

April the Best Month to Hatch—How to Set and Care for the Hen—There are Right Ways to Set Hens that Will Hatch Big Broods of Strong Chicks.

By Willard C. Thompson

IS the setting hen still an important part of our poultry industry? In the great advancement made in our poultry culture during these past few years this question has arisen. It is a direct question, and a very important one. Therefore it is deserving of a direct answer, which is, in the opinion of many poultrymen: "She is." Why is she? One hears again and again that the day of the economic usefulness of the broody hen is past. But it is not, and it seems scarcely possible that it ever will be.

There is a definite niche in the poultry raising business which the faithful old setting hen will fill season after season, and thereby contribute mightily to the progress and development of this already great agricultural industry. In the first place, there are and always will be and always should be many thousands of people interested in the raising of chickens who never rear large flocks, and whose chick flocks in the spring are limited in size and number. For this large group of poultry lovers the expense of artificial incubator equipment is an item that is cancelled. The broody hen is the cheapest incubator for the great bulk of these people.

Yet it is not only the poultry keeper whose flock is less than fifty who turns to the mother hen each spring. On many of our big poultry breeding farms one can see scores of broodies at their quiet work during the spring months. The writer took a little trip last season to some of the best known poultry farms in New Jersey, farms where nationally known Rhode Island Reds, White Wyandottes, Buff Orpingtons, and other breeds were being produced in immense numbers, and somewhat to his surprise he found that many of the best hatching eggs from the finest mated pens were being entrusted to setting hens. Certainly there must have been a reason, and therefore questions were asked, and it was striking that in every reply the statement was made that the artificial incubator was an absolute necessity in the development of our poultry business, but nevertheless there would always be a place for the setting hen.

It was a common feeling among those poultrymen, and they were men who have done much to help shape and build up poultry raising to a great industry, that the mother hens still knew pretty well how to handle the eggs placed in their nests and still held some vital secrets as to the hatching of eggs. Their chicks seemed to possess an added vigor and stamina over the artificially hatched chicks, and the percentage of hatch seemed somewhat larger. These men were after maximum efficiency in the production of baby chicks.

On all these farms visited large mammoth incubators were also in operation, proving that they were a necessary part of the commercial poultryman's working equipment. There are disadvantages to the use of broody hens, of course, but they are not of sufficient weight to warrant altogether discarding this factor in our poultry business. Now, if we can assume that the foregoing has pointed out a reason or two why we should use a bit of our time in considering the setting hen as a still useful and much needed institution, let us turn to the practical phases and see how she may best be used.

Broody Hens.

The success of natural incubation in any circumstance will

depend upon the natural instinct of the hens to go broody at the right time. During the spring months the natural period of broodiness makes itself evident in the usual poultry flock. It is simply the natural impulse of birds to reproduce their like. This instinct has been bred out of some of our birds and varieties, so to speak, as for example in our modern heavy laying Leghorns. But in the heavier meat types broodiness is still very evident. This may be much more pronounced in one strain than in another.

Usually the greater tendency to persistent, "trustworthy" broodiness comes along in April, and this month seems, for northern climate particularly, to be the best month for the hatching out of the major part of the baby chick flocks. For the men and women who have backyard flocks, and for the farm flocks of average size, April hatched chicks are undoubtedly the most economical, coming at a time when outside weather conditions are favorable and helpful to quick and rapid growth.

The broody hen that is to be used should be selected with care, for one must trust her with valuable eggs and cannot afford to pick a loser. Broodiness proves its appearance when the hens persist in remaining on the nests day and night, when they show signs of fight as one approaches their nest,

when their feathers ruffle and their wings are slightly spread, when the feathers on their breasts loosen, and when the temperature under their breasts is slightly increased. Pick the broody hen in late afternoon, and only after she has been persisting in setting on the nest for a couple of days.

Avoid the flighty, nervous hen, and choose the quiet, "clucky" kind. Choose a fairly large hen, for she will cover more eggs. If a preference is possible choose a yearling or older hen to a pullet, for they are usually more dependable. And it is very essential that the broody

selected should show every sign of being in the best of health, for the broody period is a rather severe strain on the setting hen. Inactivity needs a strong constitution back of it.

The Nest.

One of the reasons that many persons who have tried their luck at setting hens have become either discouraged or disgusted is to be found in the faulty nest that was provided. The broody hen is hardly endowed with human intelligence, and at times one is inclined to doubt that she is endowed with knowledge of any kind, and if her three weeks of patient setting is to be crowned with a good sized family of baby chicks, it is distinctly up to the person who has charge of the hen to help her by preparing a really good nest. It is not difficult, nor expensive in time, labor or money. But just a word before building the nest. Where should it best be located?

This is entirely governed by circumstances, but one general principle should be remembered, and that is to keep the nest secluded and away from interference by other birds in the flock. If only one or two or a small number of hens are to be set, a good box or barrel in a secluded spot will suffice, but if quite a few broodies are to be setting at one time "broody coops," something on the order of the one in the accompanying illustration, should

(Continued on page 488)

Would you guess that in these four nests were four nice old Barred Plymouth Rock broodies, quietly setting on some pedigreed eggs from a special mating, down on a real honest-to-goodness commercial Barred Plymouth Rock farm in New Jersey? This coop was one of several located in a protected spot near the poultry buildings. The top of the coop is hinged. The whole thing is rat and vermin proof.

The Packers' Interest In Poultry Production

Swift & Company Have Established Large Branch Houses in the Producing Districts to Handle Poultry and Eggs—How Poultry is Milk Fed—Handling and Grading the Eggs.

By Maurice King

POULTRY, eggs and butter are companion products of the farm. This applies particularly to the purchase and handling and the distribution of produce. The produce industry is one of the most important in the United States. A large amount of capital is invested in plants and in the purchase, preparation and distribution of these products. The business represents in production, purchase, transportation and distribution the employment of a large number of skilled and unskilled help.

TOTAL PRODUCTION, U. S. A.—YEAR 1919.

	Quantity	Approximate amount received by producers	No. of carloads
Poultry, pounds.....	1,767,000,000	\$ 441,750,000	88,350
Eggs, dozens.....	1,957,000,000	782,800,000	163,000
Butter, pounds.....	1,510,000,000	755,000,000	75,500
Cheese pounds.....	500,000,000	150,000,000	25,000
	6,712,500,000	\$2,129,550,000	351,850

Poultry, eggs and butter are perishable products. They represent a fast business, influenced in quality and quantity by seasons, localities and natural causes; they are subject to quick market changes; they are sensitive to the law of supply and demand; they involve the highest valued products of the farm.

These commodities are of daily production, and they meet a ready and a really undersupplied cash market. Unlike most products of the farm, they are continuously bringing in a cash income. These products vary materially in quality, by states and even by counties. No other products represent more importance to the consumer. Poultry and eggs are used extensively for direct consumption as food, while eggs and butter are of almost universal use in the preparation of other foods. No other business of such importance has gone through the rapid changes in the method of handling as that of poultry, eggs and butter during the last ten to twenty years.

It is not so many years ago that the poultry and egg business was not standardized, and lacked the modern plants, equipment and sanitary features of handling and the up-to-date mechanical refrigerating facilities to properly prepare and ship the product. Marketing was more or less spasmodic, and values fluctuated badly. With the exception of two or three months in the winter, poultry either was shipped alive, at tremendous losses in shrinkage and quality, or crudely dressed and chilled in ice water—all grades, kinds and weights packed together in barrels with cracked ice.

During the past few years rapid progress has been made in the purchase, preparation, shipment and sale of these products. Modern plants for the purchase and preparation of these products have been and are still being located at favorable central points of production; improved transportation has been furnished; the marketing and distribu-

tion have been materially broadened. Cold storage, which enables the industry to put away the surplus in the season of the peak production, to be distributed during the season of scant production, has contributed largely to stabilizing prices to the producer and costs to the consumer, and to provide and make the product seasonable through the year, which would otherwise not be possible.

A ready daily cash market is now available in all producing points in the United States, and has supplanted the old method of trading, whereby prices were uncertain and at times there was no direct outlet, and during which old period a large amount of this produce was swapped to the country merchant in trade for groceries, dry goods, etc.

Swift & Co. deserve special credit for having early established branch plants for the handling of perishable products.

Producing Milk-Fed Poultry.

At the present time, many of these branch plants, if not all, embrace what is known as a poultry feeding station. It is a large, well lighted, well ventilated, specially constructed building, containing every possible feature of sanitation.

The feeding batteries are cages of special construction, are kept spotlessly clean, and at the end of each feeding period are sterilized and thoroughly disinfected.

These batteries are of steel construction, equipped with rollers, consist of sixteen compartments, four high and twelve wide and two long, and can be well compared to the modern apartment building.

The poultry is purchased direct or almost direct, through country buyers, of the producer, carefully sorted, grouped and inspected before going onto feed. Special attention is

directed to the fact that healthy, bright, well-bred poultry is the only character of stock that the local managers of the milk-feeding stations will buy for feeding purposes.

The process of what might be termed "milking the chickens" consists of feed, given three times daily, composed of high grade oatmeal and cornmeal mixed to the proper consistency with fresh buttermilk; and here again attention is called to the important co-ordination of poultry and egg production with the production of milk, butter and buttermilk by the dairy cow.

The buttermilk contains lactic acid germs—millions of them. They are of the beneficial kind and not only are direct fat and flesh producing constituents, but the lactic acid germs assist in the assimilation of the feed, thereby getting the highest possible efficiency from the feed used.

The poultry is fed a certain number of days, according to the size and condition, and the result is a product of superior quality, white in color, tender in flesh, and of a highly desirable flavor.

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

Breed Promotion.

Breeders of poultry have usually manifested more interest in their breed than in their breed association. They have worked for breed popularity by setting high ideals of breed perfection, making judicious matings, growing the best possible specimens, showing them, illustrating them—and by advertising. The progress of breeds will always depend more on this earnest and constructive work of individual breeders than on anything else.

Specialty clubs have been numerous but seldom have they been strong forces working for the promotion of the breed they championed. A striking exception is the Rhode Island Red Club of America. It is a club that represents a community of interests. It is a union of breeders formed for the common object of doing progressive promotion work for the popularity and supremacy of the Rhode Island Red fowl.

The Red Club is officered by men of vision who have seen, and pointed out to their members, that "it is the army of beginners who make a breed popular." Having thus analyzed the situation, the club makes an especial appeal to beginners to turn them into the ranks of Rhode Island Red breeders, and a general publicity campaign is carried on to make new converts to the Reds.

The advertisements of the Rhode Island Red Club of America are familiar to all readers of the Journal. The purpose of these ads is to reach the general poultry public, and impress and convince the public of the merits of the Reds and the satisfaction and profit to be derived from breeding Reds.

Last year a substantial fund was raised for advertising purposes, and another fund is again being raised to enable the Club to continue its "booster campaign" for the breed. This "booster fund" is secured by effectively pointing out to breeders, particularly the large and successful breeders, that they have two responsibilities, one in promoting the interest and welfare of their own business, the other in promoting the interest and welfare of the breed on which that individual business rests.

The Red Club is not satisfied with membership dues that

amount to \$2 a year. The club expects breeders who can afford to do so, to give \$50, or \$100, or \$250 for breed promotion work.

It is sometimes said that "no other breed has ever had the long sustained boom that the Rhode Island Red has enjoyed." But, it is not a "boom." The demand for good Reds has continued to absorb the supply, because not only are new flocks being established, but every time a new flock is established, a new customer is added to the list of those who, from time to time, will buy new blood to reinforce that flock.

Another club, championing an older breed, but not content to rest upon the laurels of the past, rises to participate in sound promotion work. We refer to the American Brown Leghorn Club, which is furnishing a metal poster 13½ inches wide by 19½ inches high to each breeder of Single Comb Brown Leghorns who is a member of the club. The sign is for local advertising purposes. On it appears a large picture of a Brown Leghorn female and a clutch of big white shelled eggs.

When the sign is nailed to the fence along the roadway the pictures on it will attract the attention of passers-by, and will impress and be remembered by all of those who think of hens in terms of eggs. The lettering on the sign is large and plain. It reads "Purebred Brown Leghorns. They Lay More. Stock and Eggs for Sale Here. Members of American Brown Leghorn Club."

There is a sound and forward-looking idea back of this sign. It used to be that poultry fanciers bred birds to sell to other fanciers. It was believed that there had to be a White Wyandotte fancy, a Barred Rock fancy, a Brown Leghorn fancy, each "fancy" being composed of small fanciers who admired and supported the big fellows.

The order is changing. The breeds are being put out into the hands of Mr. Average Poultry Raiser all over the country. What may be termed "local breeders" are realizing that it is not necessary for them to struggle in the great show room contests, or fall as easy prey to advertising solicitors whose write-ups are promised to result in a "national repu-

tation." Instead of this, strong local demands for Standard-bred poultry are being developed. The local breeder is installing big hatching equipment and producing chicks for folks in his county, he is operating a breeding establishment to which farmers and poultry raisers may come for chicks, eggs for hatching and stock birds. Thus is the purebred poultry breeding business becoming linked with the substantial, enduring agriculture of the nation.

This makes the base brooder for every good breeder, every big breeder. The blood lines that leave his farm in tiny rivulets grow into mighty streams as the offspring are traced through the many farm flocks. It makes it possible for the breeder's business to send its tendrils climbing over tens of thousands of farms, and enriching every farm that the vines touch.

Breed associations are seeing this enormous outlet for stock of our improved races of domesticated fowls. They are beginning to work along the lines of breed promotion. That means thinking less of specialty club "special prize ribbons," and thinking more of broadening the base on which breed popularity rests. It means thinking less of developing some faddist feature in our breeds, and thinking more of producing those sturdy, useful types that will prove the worth of the breed in the struggle for breed supremacy.

Some day the American Poultry Association, as a great breeders' organization, will employ the intelligence required to gather facts and figures on the breeds, and start in to do effective field work, scattering propaganda broadcast in behalf of Standardbred poultry, driving home the arguments in favor of Standardbred poultry, and making available to every new breeder, at nominal cost, a copy of the Standard of Perfection which sets forth the ideals to which the breeds are bred. The difficulty up to this time has been that the field was too big and the funds available too small.

As breeders, America, rich in potential possibilities, lies undeveloped before us. We cannot ask for greater opportunity. The future is great beyond our poor ability to measure it. It will be limited only by our vision and our ability to produce those types which will measure up to the expectations and meet the requirements of those who buy. It is for us to ask for vision to see, and strength and ability to do.

Standards Should Be Advanced to Meet Advanced Ideals of Times.

The excellent article in this issue of the Journal on *Bringing Back the Spanish*, by Clarence Hewes, will be read with interest by many breeders, in addition to those who are breeding Spanish.

The White Faced Black Spanish has long been looked upon as an example of what selective breeding can do in the development of a single feature into an abnormality. When one character in a breed is greatly elaborated, such importance is attached to that character that the breed becomes a one-feature breed, loses its balance, and fails to advance with the steady progress of competing breeds. It is then out of the consideration of beginners who are interested not in that achievement of breeders of a past generation, but in the progress of present-day breeds in which they may take a part.

There is practically no danger that our modern economic breeds will ever be subjected to such freakish development as was the fate of some of the grand old races of the past, which were bred by men who had little conception of the economic importance of improved races, or the true relation that should exist between constructive breeders and the poultry industry.

At this late date the Spanish was about to be abandoned to those who fancy the unusual and the odd, when along comes Mr. Hewes and says: let us restore the Spanish to its previous high estate by returning to the type that gave the breed its early popularity.

Mr. Hewes has taken the position that he will not breed big pendulant faces on his birds, even though, as at the Chicago Coliseum Show last December, he must for a time be satisfied with minor prizes. Regardless of the prevailing fashion, he has set his stakes to breed a well balanced fowl;

not that type of heavy faced male that tires easily in the confinement of the show room and thrives only under the favorable conditions in the home yards.

Live stock men would call such a male "pampered"; poultrymen term him "soft"; and it does not pay to grow a soft lot of stock, that is, stock which has been devitalized by artificial comforts and environment which are necessary in the development of an extremely large white face.

The call is for rugged stock of types that are adaptable to the ordinary conditions of plain poultry raising as carried on by average poultry keepers.

Mr. Hewes deserves the thanks of all well wishers of Standard poultry breeding as a man's business, not a mere hobby, in accepting that responsibility which every breeder should owe to his breed, and trying to bring about the adoption of practical ideals for the breeding of the distinctive and elegant Black Spanish.

In emphasizing width across the hips as measured by the hand, and securing good abdominal capacity, he brings to the attention of breeders new features of this new age.

Under such leadership the Spanish will go forward and will be loosened from the bounds of traditions which have been transmitted to us by an age that is past and gone.

The Egg Market.

The quantity of eggs stored last season would not have been adequate to meet current needs under normal weather conditions. The storage eggs of 1920 began to go into trade channels early in the fall, and by February 1 the stocks in the refrigerators were so completely cleaned out that there would have been an actual shortage of eggs had not the winter weather broken. The mild January weather started the southern farm hens into laying early in the season.

As the days began to lengthen and the sun climbed north, farm eggs from Missouri, Oklahoma and Tennessee began to go into the market; and by the latter part of March, the hens of the great corn belt, from Ohio to Nebraska, and from central Illinois to the Dakotas came into full lay.

A vast surplus of eggs is always produced in these early spring months. The seasonal decline in prices, which comes every spring, is not a reflection of decreased consumption, but is due directly to the seasonal surplus, which packers and speculators are asked to buy and lay away in their refrigerator store houses against the need of the coming fall and winter.

The spring dealing is largely in farm eggs. The commercial poultryman times his hatching operations so that his pullets are laying eggs throughout the period of high selling prices, which is October 15 to January 15. The farmer, generally speaking, does not produce winter eggs. He carries his birds through the winter at a minimum of cost. His egg production comes in the spring when his hens are on range, picking up an important part of their food.

It is not expected that the commercial egg farmer should compete with the farmer in the production of spring eggs. The specialized egg farmer has made his big profits during the winter. The farmer, on the other hand, is unable to participate in supplying the fall and winter market with fresh eggs, for he lacks the early hatched pullets to produce the eggs; neither does he have the necessary equipment nor the "know how" to get fall and winter eggs.

It is, however, a mistake for the commercial egg farmer to say: "I am not interested in the farmer, or farm egg production. I produce fresh eggs in the fall and winter when the farm hens, eating whole corn and drinking ice water, are loafing. What about the market next winter?"

It is true that the producer of fresh eggs in the fall and early winter gets a premium for his product. But, it is a premium on what?

The premium price for fresh eggs is a price that is based on the general market quotations. If eggs go into storage at a relatively high price in the spring, they will come out at a relatively good price in the fall and winter, and the premium to the fresh egg producer will be added to a high base rather than to a low base.

Prices for spring eggs depend partly on the likely needs of the consuming public. In this respect the position of eggs is strong, for the public has demonstrated an enormous capacity for the consumption of poultry products.

Prices for spring eggs are also governed somewhat by the prevailing prices for other meat products. In this respect the position is weak, because grain, which is the principal item entering into the cost of producing meat products, is low in price. Grain on the farm is again cheap, and it naturally follows that egg prices should be lower this spring than last spring.

Cheap grain should encourage the commercial egg farmer, even though it is the cause of a lower spring egg market. Cheap grain means that it will cost less to grow the pullets during the summer growing season. The animal

machines will cost less to produce this year.

When these pullets begin to lay, cheap grain means that the important thing, the margin, is saved; for it is the margin between what the feed man asks and the buyer of eggs pays, that counts. If it cost 50 cents last winter to produce a dozen eggs that sold for 90 cents, and it will cost 35 cents to produce a dozen eggs this coming winter that will sell for 75 cents, the poultryman is as well off as when he was selling eggs at 90 cents, for in both cases the margin of profit is 40 cents.

There is one thing on which we can always count. That is, fresh eggs during the fall and early winter always sell for twice and, sometimes, three times as much as during April and May.

And corn and oats promise to stay where they are, that is, back at the old

pre-war prices. There is a big harvest of grain, and there are fewer animals in the country to eat it. The production of corn is 112 percent, the number of beef animals is 90 percent of normal.

The outlet for the great annual corn crop is as feed for animals. Human beings cannot eat all the corn that we grow, or even an important part of it. We in this country eat about 500,000,000 bushels of wheat a year. How could we eat six times that much corn? We eat about five bushels of wheat per capita, and yet we produce about thirty bushels of corn per capita.

Corn is largely marketed in the form of beef and pork, and when the number of corn-consuming animals decrease, as they have during the past year, and the corn crop is a three billion bushel crop, as it was last year, it is somewhat easier to understand why corn on the track in the Midwest is today worth only 60 cents a bushel.

If corn were \$2, as many farmers and speculators hoped it would be, and selling prices of meat products were inflated to the same extent, the outlook might be alluring to the superficial; but commercial egg farmers should see less risk and uncertainty in the present return to lower feed prices.

"But It Doesn't Mean Anything."

In "A message from Sprague," dated at Maywood, Ill., season of 1921, P. R. Sprague writes:

Dear Fancier: This is my nineteenth year breeding Rhode Island Reds exclusively. I am the oldest breeder of Reds in the West. I purchased my foundation stock in 1902 from the best breeders in Rhode Island, Massachusetts and New Jersey, the best birds obtainable at the time.

This same Sprague, advertising under the name of P. E. Sprague, Maywood, Ill., states:

Why not buy your stock and eggs from the oldest breeder of Reds in the West? I have devoted my entire time to the poultry business since 1882—39 years. I have bred Rhode Island Reds longer than any other breeder west of New York. My stock is the best money, experience and careful breeding can produce. Everything that goes toward making fine Rhode Island Reds can be found in my flock. Ninety twenty-one Red Book and mating list now ready and will be sent to you free.

The reader who sends for this mating list is introduced to a third Mr. Sprague. It is neither P. R. Sprague nor P. E. Sprague, but P. H. Sprague, and a facsimile reproduction of the signature assures the reader that P. H. Sprague is the lawful name of the man whose picture has appeared in connection with the different initials.

The reader is assured in this mating list that this is Mr. Sprague's "nineteenth year breeding Rhode Island Reds exclusively." Also, that he is "the oldest breeder of Reds in the West." It is not just clear, however, what value is to be attached to this long association with the variety, inasmuch as Sprague says: "I improve by introducing new blood yearly." Thus does he admit that he has not established a strain.

When the keen buyer stops to analyze this situation, Sprague's claim that he is "the oldest breeder of Reds in the West" is worth no more than the statement of a man who says: "I have been breeding Reds for three years; I got hold of a few good females in the beginning, and each year I have sent to a

Hillview Strain

Stands Supreme, and they are America's foremost line-bred

Single Comb

White Leghorns

1st Cockerel, Coliseum, 1919

A REPUTATION WON ON QUALITY

Have made amazing records in Egg Laying contests of National Fame—and record winnings in America's largest Show Rooms. The impressive winnings of Hillview Leghorns of almost every ribbon at the Chicago Coliseum show of 1918-1919-1920, and the winning of first prize Pen in Missouri and American Egg Laying contests, is still an unbroken record.

OFFICIAL SCORES PROTECT YOU

Our 1920 Coliseum Wins

2-3-4 cock; 2-3-4-5 cockerel; 1-4-5 hen; 1-2-3 pullet; 1-2 old pen; 1-4 young pen; largest and best display. We won 106 points—nearest competitor won but 28 points.

Our 1919 Coliseum Wins

1-2-3-4 cock; 1-2-3-4-5 cockerel; 1-3-4-5-6 hen; 2-3-4-5 pullet; 1st and 2nd young pen; 1st old pen and all specials.

Layers? Look at This!

At the last Missouri Egg Laying Contest five Hillview birds hatched June 26th laid 1096 eggs for the year. Best record over all Leghorn pens from Jan. 1st to Oct. 31st.

Other Egg Laying Contest Winnings

Individual Official Records

257, 248, 263, 217, 248, 257, 251, 202, 230, 243, 240, 246, 267, 221, 233, 208, 238. 1st prize pen Missouri Egg Laying Contest, 1918. 1st prize yearling hen pen American Egg Laying Contest, 1918.

The Winnings of Our Customers

is the main factor of Hillview success. We have no reserve matings or birds. The winnings of our customers at St. Louis, Kansas City, Omaha, Chicago National, Hagerstown, Alabama, Louisiana, Illinois, Ohio, Oklahoma, and many other State Fairs, Canada, and all over the continent, is convincing proof that we share equal honor by furnishing them the best of our many years of selective line-breeding.

Hillview Leghorns Produce Champions by the Hundreds, and They Are Not the Products of Chance or Purchase, but Years of Scientific Breeding.

Hatching Eggs and Baby Chicks

from Hillview will assure you the most pleasing results, because they are from the best matings in the world. Book your order now to insure prompt delivery. Satisfaction guaranteed. Illustrated mating list free. Write today.

HILLVIEW FARM BOX 4004 BENLD, ILL.

Purina Chows Made the Difference

BOTH are six weeks old, but just look at the difference! The poorly feathered one on the left is an average chick fed an average grain ration. That sturdy chick on the right is the same sort of chick fed Purina Poultry Chows.

Decide for Your Chicks Today

Order Purina Chows now, before that next lot of chicks hatch out, and before the ones already hatched have a chance to become stunted for lack of sufficient protein and minerals in their diet. Put the Purina guarantee to the test.

Buy Purina Chows under a money-back guarantee of Double Development

If baby chicks, when fed Purina Chicken Chowder with Purina Baby Chick Chow as directed, do not develop twice as fast, during the first six weeks as when fed a grain ration only (ground wheat, corn meal, stale bread, etc.) the money paid for both chows will be refunded. This is decision day, see your Purina dealer. If you don't know who he is, write us. Ask for the Purina Book.

RALSTON PURINA COMPANY

Get the 1921 "Purina Book"

This book has grown in practical value from year to year, until it has become packed with such information as this:

How to detect slacker hens without the aid of trap nests. How to care for chicks. Cure of Diseases. How you can be guaranteed more eggs by proper feeding.

*Feed
From
Checkerboard
Bags*

good breeder such as Delano, Harold Tompkins and Mrs. Mahood for a male to head my pen."

When a man proudly claims that he improves the quality of his stock "by introducing new blood yearly," and thus admits that in his nineteen years of practice with the variety he has not produced a *strain* or established a family of Rhode Island Reds, either Single or Rose Comb, what value is to be attached to this same man's statement that "I am the oldest breeder of Reds in the West"?

The phrase "oldest breeder" may at first convey an important value to the mind of the prospective buyer, yet in itself it does not mean anything to the man or woman who wants to buy linebred stock that will breed on and on. A man might be the "oldest breeder"

and at the same time be one of the poorest breeders in the country.

Sprague emphasizes that he buys from well known breeders, listing the names of several of them in black face type.

In other words, he buys from constructive breeders birds that will grade up and improve his stock. We assume, therefore, that his matings are dominated by the new blood, the good male birds that he introduces into his yards.

Yet Sprague would not have you do as he does, that is, buy from a breeder who has established a strain, who has developed strong blood lines that are prepotent, and that can be depended upon to stamp high quality in their progeny. Oh, no. His advice, as published over his signature in his mating list, is:

If you want to put new blood in or improve your flock, do not try linebred (inbred) stock or eggs, as all of the line breeders tell you their poultry is and must be linebred (inbred), and the blood line must not be broken, or results will be disastrous. What they all say must be true, and linebred stock will not improve your stock, as the blood lines will be broken.

Can you beat it? The stock that the reader of this mating list is advised not to buy is very evidently the kind of stock that Sprague himself does buy to improve his own crossbred flock.

And yet he tells us in this same mating list: "It takes less time to buy show birds than to breed them." Sprague ought to know. Compared to nineteen years of breeding, the buying of a good pen header is both an easier and quicker process.

Sprague also urges all beginners not to spend too much money for a setting of eggs. Five dollars is enough. Says he:

I claim and can prove that my eggs at \$5 per setting are the same or better value and quality as some of the big fellows are asking \$10 to \$20 for. I also claim that eggs from the best of stock can be sold at \$5 per setting and make a good profit for the breeder.

So we are told that eggs can be sold from "the best of stock" for \$5 per setting. It is pretty generally understood among breeders that a pen of Reds that would grade as among "the best of stock" is headed by a male that has a cash market value of \$300 and contains approximately ten females that are of values ranging from \$50 to \$100 each. It is foolishness, or rank ignorance, or both, to say that eggs for hatching from such a mating can be sold at \$5 per 15 and "make a good profit for the breeder."

But "oldest breeder of Reds in the West" probably carries the load of a successful advertising campaign, although we fail to see that the slogan really means anything.

Hatch in April and May.

Because of the unusual open winter and mild March weather, a great many orders for hatching eggs were placed early. Some of the best birds of the year, however, will be grown in April and May, as always. Do not underestimate the importance of April and May hatching, or the value of April and May chicks. Early chicks are necessary for the early shows, but the winners at the big winter shows will be largely April and May chicks; they will have the color and the quality.

Build on a Quality Foundation

The best cost but little more than the ordinary kind; 15 eggs from a choice pen will ultimately be worth more to you than 100 eggs from stock of fair quality. Every pen at Sunnyside is headed by a male whose hens have averaged 200 to 249 eggs per year.

No matter what your wants may be you can rest assured that they will be well filled when you order

Pedigreed and Trapnested SUNNYSIDE BIRDS

White and Buff Leghorns, R. I. Reds, Barred and White Rocks, White Wyandottes and White Orpingtons

Hatching Eggs from 200 to 249 egg hens, trapnested pedigreed stock. We guarantee safe delivery, and send you the same eggs as we use ourselves. Prices for January, delivery and after:

100 eggs; any variety; 180-200 egg..	\$12
100 eggs; any variety; 210-248 egg..	14

PURE DRIED BUTTERMILK

FOR BABY CHICKS
AND GROWING STOCK

FOR
LAYING HENS

Now Ready for All Poultry Raisers

Pure, fresh creamery buttermilk—just as it comes from the churn—nothing added, nothing taken out except the water—92 lbs. of water being withdrawn from every 100 lbs. of liquid buttermilk. Our new patented process not only retains the lactic acid but all the food and energy giving elements of buttermilk as well.

"P. D. B."—Pure Dried Buttermilk is a Health Promoter and Egg Producer. It has a digestibility of 100%. As a preventive and remedy for White Diarrhea in Chicks, it is unsurpassed—it is the best digestion regulator known to modern science.

Professor T. E. Quisenberry, Dean of the American Poultry School and one of the world's foremost poultry authorities, says: "P. D. B. in my opinion is the best animal protein for Baby Chicks, Growing Stock and Laying Hens."

Ask Your Dealer for Pure Dried Buttermilk

Look for the package with the red circle containing the "P. D. B." trademark—the big, generous, five-pound package; enough to feed a big flock for some time. Only a small percent of this rich concentrated food is required to balance the ration. It is a real feeding economy. Be sure to get the original sealed package. Accept no substitute. The P. D. B. in the red circle guarantees that you are getting pure dried buttermilk—no adulteration, no fibre, no filler of any kind. If your dealer can't supply you, send us his name and \$1.25 and we will send you a 5-pound package by return mail postpaid. Complete feeding instructions on each package. Just fill out the coupon below or write us.

That way they are working for the lice. If you put Trenton Rock Crude Oil on them, both your chickens and your hogs will begin working for you instead of the lice. Special reduced pre-war prices—five gallon cans, \$3.00; ten gallon cans, \$5.00. Write for circular and prices on barrel lots. Now is the time. Write us today. Mention this paper.

M. J. ANDERSON WARREN, IND.

Thomas F. Rigg Leads the Field for President.

Nomination ballots for president of the American Poultry Association were counted on March 3, and the following returns were announced by election commissioner O. L. McCord:

Thomas F. Rigg, Iowa Falls, Ia. . 892
J. H. Wolsieffer, Vineland, N. J. . 649
Russell F. Palmer, Kansas City, Mo. 396

In acknowledgment of this splendid vote, Mr. Rigg says:

The endorsement given me on the nominating ballot is to me evidence that the members wish to see the affairs of the American Poultry Association conducted upon sound business principles; that they have a vital interest in the association and for all it stands and should properly stand.

Photo of Thos. F. Rigg. Taken in New York at the Close of the Recent Madison Square Garden Poultry Show.

For more than thirty years I have served the American Poultry Association, giving freely and without stint of my time and effort. I have done this wholly for "the good of the cause." I would like the opportunity of serving the industry in a more substantial manner.

I believe in the American Poultry Association, its objects and its aims. I have an abiding faith in its power for good. I believe the association should be broad enough to serve in a practical way, to protect and to further the interest of Standardbred poultry in all its branches.

If given the majority vote for president, I pledge you that I will serve the association and all interests affiliated therewith to the best of my ability, giving to the same my entire time and the best there is in me.

"Upon this rock I stand," asking you to give me the order to serve.

Election ballots will be mailed to members of the A. P. A. early in April. No member should fail to vote. There is big and important work to be undertaken by the association.

One member, W. H. Card, judge and breeder for a quarter century, and widely known as the result-getting secretary of the Rhode Island Red Club of America, publicly states how he shall cast his vote for president of the American Poultry Association in the following announcement:

TO WHOM IT MAY CONCERN:

Believing that Thos. F. Rigg of Iowa Falls, Iowa, is the logical man for the high posi-

tion of president of the American Poultry Association, and being a man of the highest character in his private and public life, a thorough fancier of the old school, a man of independent means and liberal education, a man who represents the highest type of America's best manhood, I shall cast my vote for said Thos. F. Rigg for president of the American Poultry Association.

Walter Hogan Is Dead.

Walter Hogan passed away at his home in Petaluma, Cal., Feb. 4, 1921, after a period of ill health extending over a number of years.

Mr. Hogan was well known in the poultry world, having made an important contribution to poultry knowledge in pointing out that thin pelvic bones indicate the egg-laying temperament, while short, thick, lumpy, fat pelvic bones indicate that type of hen whose very nature is to convert food into body fat. He also showed that large intestinal capacity, as indicated by good distance from the pelvic bones to end of keel bone, was necessary for high egg production.

The good layer has intestines that are about twice as big as the poor layer. Big intestinal development allows for a big assimilation of food; and the heavy layer must be a hearty eater. It is also important that the abdomen should be soft and pliable if the hen is to be a good layer.

These are simple rules, easily applied. They are the basis of the Hogan system. Modern culling practice is also based on them. Indeed, the poultryman who culls, Hoganizes to no small extent. He may include the pigmentation tests, but, after all, faded vent, beak and shanks are the result of egg laying, not the measure of egg capacity.

In appreciation of Walter Hogan's work, T. E. Quisenberry writes:

I really believe that Hogan deserves more credit than he has been given up to this time, for the good that he accomplished and the ideas that he worked out.

Hogan's method was not absolutely perfect, but he discovered an idea that set all the poultry investigators to work, and while they may have discovered a few little new ideas here and there, when you get down to the real basis of all of the improvements that they have tried to make in Hogan's system, you find that after all it was Hogan's idea which was the basis for all the systems of culling that have been put into practice.

For several years Mr. Hogan has been in failing health. The year that I had charge of the San Francisco Exposition poultry show Hogan spent a day with me practically every week, and he was in such poor physical condition at that time that he could not talk for fifteen minutes without his mind becoming an absolute blank. That is the reason that Mr. Hogan has not been able to improve his own system, or combat the criticism that has been offered on his method; but, after all, I think every poultry authority in the United States will concede that it was Walter Hogan's idea that set all of us to investigating, and that we all owe him a debt of gratitude for what he did for the poultry industry.

Well said. Walter Hogan's system is the most valuable piece of knowledge ever given to poultrymen in the history of poultry breeding, and ranks in importance with the invention of incubators and brooders in the field of artificial hatching and rearing.

Judging in our shows will some day take into account the salient principles of the Hogan system, and that will mean the revolution of judging.

Walter Hogan put his knowledge into a poultry book, which he entitled "The

The Layers Win and the Winners Lay Regal Dorcas White Wyandottes

Regal X First Pen Cock, Boston, 1918

are the most popular strain of this popular breed in America today, because they combine beauty and usefulness to such a marked degree.

Regal Dorcas White Wyandottes are the typical American White Wyandotte, not the slim-bodied, high-tailed, beefy-combed kind that are Wyandotte in name only. My birds are the modern kind with low, close-fitting combs, deep bay eyes, rich yellow legs, broad backs, low, well-spread tails and chalk white plumage.

In the laying contests they are invariably near the top while in the show room they acknowledge no superiors. They hold their record for best display at Boston with a score of 72 points.

At Madison Square Garden, 1919, they won best display with a score of 68 points—40 points more than all my competitors combined.

At the National White Wyandotte Club Meet held in Kansas City last November, the Regals won 43 ribbons on 43 entries—the most wonderful winning in the history of the breed.

In the American Laying Contest at Leavenworth, Kansas, my birds won first over all the heavy weight varieties, eight of my pullets making a combined record of 1,761 and average of over 220 per bird.

If you are not getting good results in fertility or egg production, if your birds are weak in constitution, why not make a fresh start with the Regal Dorcas line. My matings for 1921 are a wonderful success and the 2,000 early chicks in my brooder house give ample proof of this. Do not delay but reserve your eggs before it is too late.

Eggs for Hatching

Dorcas matings—\$5.00 per 15,
\$15.00 per 50, \$27.00 per 100.

Special matings (Exhibition or Dorcas), \$10.00 per 15, \$18.00 per 30, \$25.00 per 45, \$50.00 per 100.

All Star matings—\$20.00 and \$25.00 per 15.

Utility matings—\$15.00 per 100.

Special Utility matings—\$20.00 per 100.

1000 Surplus Males and Females for immediate sale at bargain prices

Special value breeding pens (male and five females)—\$40.00, \$50.00, \$75.00 and \$100.

Choice breeding cockerels—\$8.00, \$10.00, \$15.00, \$20.00 and \$25.00.

Hens and pullets—\$5.00, \$8.00 and \$10.00.

Utility cockerels (in lots of 5)—\$5.00 each.

Free—Send for 20-page catalog fully illustrated, telling all about my 1921 matings.

Send 10c for copy of the Regal White Wyandotte Book—the information it contains will be of great value to you.

John S. Martin, Box 51, Port Dover, Ont., Can.

Call of the Hen," and more than 35,000 copies of the book have been printed and have found their way to all parts of the United States and to foreign countries.

T. E. Quisenberry, in his official capacity as director of the Missouri Poultry Experiment Station, was the first poultry authority to recognize the merit of the Hogan test, and he did more than anyone else to command serious respect for the Hogan book and impress poultrymen with the value of the Hogan system.

Walter Hogan, not fully appreciated in life, is dead. The old man, who was

The Late Walter Hogan.

sometimes termed "a crank" in this world, can now carry on his studies of reproduction in the fowl species, in a land of kinder companionship, near the Source of Life itself.

It is unimportant that he did not make money for himself or left no large estate. The world does not long remember the great getters, but it does reverence the great givers. And Walter Hogan, who studied, and tested, and experimented, and at last learned to understand the relation of a hen's anatomy to her egg productive power, has left to every poultryman, no matter how humble or far away, a heritage of knowledge that will enable him to select the useful hens from the drones.

A service to all the poultry breeders of the world—that is a big enough monument to perpetuate the memory of any man.

Improve One Point at a Time.

The points that a breeder can aim for in one mating are limited. Did you ever see a mating that was likely to correct and improve more than three or four points? As a rule advancement is made one point at a time.

The Buff Leghorn breeder secures a red-eyed bird to improve the eye color this year. Next year he buys a hen with sixteen tail feathers, eight to a side; a hen whose two top maintail feathers are long, and whose tail coverts are very long and numerous. From such a hen he expects to produce cockerels with the fully finished tails that he desires. Thus he advances in his breeding operations from year to year, step by step.

Farm Poultry Flocks.

In northern Illinois there is a farm advisor, called farm agent in other states, who has been doing some good work along poultry lines. His name is F. E. Longmire and his domain is Grundy county.

Advisor Longmire moved to Illinois from Missouri, where he had previously

F. E. Longmire.

done county agent work. The land is less productive in Missouri and poultry is a relatively more important source of income. Not that the farmers of Missouri sell more poultry and eggs than the farmers of Illinois, but that the farmer of Missouri sells somewhat less of

other things, which results in making his poultry a relatively more important branch of his farm enterprise.

Longmire carried his knowledge of poultry and his interest in the farm flock into his farm advisor work in Grundy county. He began in the fall of 1918 to interest his farm bureau members in poultry problems by putting on a series of poultry culling demonstrations. These meetings were well attended and as much interest was evinced in the subject of poultry by the rich corn belt farmers as in any other kind of demonstration that had ever been held in the county.

Longmire knew that after the birds were culled they would give a better account of themselves if they were fed properly, and not merely wintered on corn and oats; but he also knew that the fundamental thing that underlaid permanent poultry success was the right kind of a poultry house, and that culling and feeding, while interesting and important phases of the poultry subject, were superficial until that fundamental thing, a properly designed poultry house, was constructed.

His culling demonstrations brought out the people, and the talks on eliminating slacker hens and feeding poultry for profit directed attention to the possibilities for profit in the farm flock; but of those who seemed to be serious about their poultry, Longmire took special note and at the first opportunity showed them plans for poultry houses that would fit their farm, meet their conditions, and adequately house the number of hens that they kept.

Several men in different parts of Grundy county liked the looks of these houses on paper, and in the summer and fall of 1919 a half dozen new poultry houses were built.

A Dr. P. T. Woods fresh-air house was erected by E. G. Caisley, who owns 160 acres of rich Grundy county land, and whose barns, corn crib, hog house and other outbuildings are of the best and most modern type.

Mr. Caisley's new poultry house happens to be so situated that it can be seen by passersby for more than a quarter mile down the highway. It is painted red and faces south. The building rests on a cement foundation and has a cement floor. It is 20 feet by 20 feet on the ground.

PUT YOURSELF IN THIS MAN'S PLACE

Jim Taylor Did and Here's the Story

"WHAT MADE JIM TAYLOR LATE FOR SUPPER"

Mrs. Taylor was worried, for Jim was seldom late for supper. Finally she heard footsteps outside and Jim opened the door.

"I couldn't help it, Polly, just couldn't help it," said Jim, as he put the bank book on the table, "we are going to have our new poultry house this spring. I have just paid off the mortgage on the place and bought the lumber for the new building, and see" as he took up the bank book, "we still have \$2,000 in the bank."

"Just think, Jim," said Mrs. Taylor, "the chickens, and The National Poultry Institute did it all."

"You are right, Polly. It was a lucky day for us when I enrolled for the Poultry Course of The National Poultry Institute, of Washington, D. C. I am going to put up the new poultry house according to their plans."

"It doesn't seem possible, does it, Jim," said Mrs. Taylor, that two years ago you were working for some one else, and today we own our own home and poultry plant; we are able to put up a new poultry house, and have a snug bank account besides. It beats working for the other fellow."

NOW IS THE TIME TO START. THE BIG SEASON IS HERE. Make ready for a large harvest this year. Put yourself in Jim Taylor's place. Poultry pays big profits to those who know how, and the nationally-known, successful poultry experts of The National Poultry Institute WILL SHOW YOU HOW TO PROFIT.

Ordinary care plus H-O STEAM-COOKED CHICK FEED will raise every normal chick.

You need not lose a single chick because of indigestion, raw or sour feed.

H-O STEAM-COOKED CHICK FEED

is a scientific combination of sweet, wholesome grains. These grains are cracked to pin-point fineness and steam-cooked by our exclusive process. Steam-cooking makes this feed digestible for the feeblest chick. They get the full benefit of the nourishment in the grains.

Read What Successful Breeders Say

Sunny Vale Poultry Farm

Seelyville, Pa., Nov. 29, 1920

I have used H-O STEAM-COOKED CHICK FEED for young chicks for several years with the best possible results.

Last season I raised about 2,000 chicks. I had broilers weighing two pounds each when two months old, and red pullets were laying at five months old. At present, November 29, we are getting nearly 50% egg production from the pullets. I give credit to H-O STEAM-COOKED CHICK FEED in getting them started right.

(Signed) H. A. Robinson, Prop.

H-O STEAM-COOKED CHICK FEED is packed in handy five-pound packages durable, space-saving and just the right size to feed. Also put up in the usual size bags, 100, 50, 25 and 10 lbs.

Insist that your dealer give you H-O STEAM-COOKED CHICK FEED and get the profits from live chicks.

J. J. Campbell, Mgr., P. O. Drawer, 1436

This depth of 20 feet from front to rear is an important consideration in a farm poultry house. It prevents the wind from blowing in and onto the birds roosting in the rear.

A shallow house of the open-front type is not satisfactory on the farm, for it requires too much adjustment. If a storm is blowing, curtains must be lowered to protect the birds roosting in the rear.

The average farmer wants a self-regulating house. After he has done his chores and gone in for supper, he does not want to have to put on his boots and come out in the evening to adjust curtains in the hen house. Farm poultry houses in the northern states should be built 20 feet deep from front to rear, so that the birds can roost well back from the openings in the front.

It is desirable to provide some open space, covered with wire cloth, in the

E. G. Caisley's New Poultry House.

front. Wire cloth with ¼-inch mesh should be used in preference to ordinary 2-inch netting, so that sparrows cannot fly through the wire and into the house, carrying lice, roup or tuberculosis. Wire cloth is also effective in turning snow and rain, although it will not stop a beating rain from coming in.

The south front of Mr. Caisley's house is 4 feet 8 inches high. It is boarded up for 2½ feet and then there is an open space of 2 feet which is covered with wire screen. This allows the outdoor air to enter, and the indoor air, that has been breathed by the fowls, to pass out.

Air that has been once breathed has had some of its oxygen taken out by the living fowl, and it has had some poisonous inorganic matter deposited in it. Best of health cannot be maintained when fowls are housed in a close coop and are compelled to breath over again air that has been once breathed.

Moreover, a tight poultry house soon becomes damp. Fowls throw off a great deal of moisture with their breath. When the air within the poultry house, laden with water vapor, is not carried out of doors, the litter and inside walls become covered with moisture. On a cold morning the walls may appear frosty, and as the sun comes out and warms up the boards, drops of water begin to trickle down. Chickens cannot thrive in damp quarters.

The solution of dampness is ventilation. Sometimes when adequate ventilation is recommended a fear is expressed that hens will suffer from the cold. It should be remembered that chickens are well protected by a wonderfully woven fabric in the form of plumage, and they are fitted by nature to enjoy a well ventilated, dry house.

The sun shines into Mr. Caisley's house through eight windows in the

semi-monitor roof. Each window is 24 by 32 inches, and each contains four panes of glass 9 by 14 inches. Light from these windows reaches the rear of the house.

The back wall is 5 feet high. The center of the house is 6½ feet from the floor to the low roof, and 4 feet more to the high roof.

The house cost about \$200. It was built when materials were high. About

New Poultry House on the Hunt Farm.

125 Barred Plymouth Rocks are wintered in it, and their eggs the first year paid the cost of constructing the building.

What dairy farmer could pay for a new barn with the milk of his cows the first year; or what hotel company could pay the cost of constructing a new hotel with a single year's receipts from guests? Yet hens pay quickly for a decent place to live in, and there is no economic reason why a hen house should be the most dilapidated building on a farm.

The hens have paid for their house on the Caisley farm, and Mr. Caisley has a poultry building that is in keeping with the other improvements on his farm. It is not an old shed, poorly ventilated and poorly lighted, with a contaminated dirt floor. It is a modern poultry building.

About five miles north of the Caisley farm is to be found another poultry house that was built after plans furnished by Advisor Longmire. It is on the Hunt farm, and is of a little different pattern, but the fundamentals are the same, i.e., fresh air, sunlight, and dryness.

This house of Miss Millie Hunt's is 20 by 20 feet. About 100 pullets were housed in it the past winter, although the total hens and pullets on this farm numbered 285, and they were divided between the new house and two other old but remodeled buildings.

The plan for the new house was designed to permit of as little waste in lumber and as cheap construction as possible.

Old Poultry House on the Hunt Farm.

Why U. R. Fishel's White Rocks Are The Best

Male Birds Worth While To Head Your Yards

"I Raised to Maturity 92 Chicks

out of the 100 shipped me," writes a customer who bought chicks of me last year. Chicks that are hatched right and bred right, will live and thrive.

Monmouth Poultry Farm, Box 3, Freneau, N. J.

S. C. W. Leghorns Bred for Egg Production Barred Plymouth Rocks

Breeders, Cocks, Cockerels, Hens, Pens, Trios. Hatching Eggs \$15 per 100 up. Book Orders Early. **MAYROYD POULTRY FARM, Box 64, New Dorp Heights., STATEN ISLAND, N. Y.**

The foundation is a concrete wall 7 inches thick and about 10 inches above the ground level. Ten-inch drain tile were sunk on end, 2 inches below the level of the top of the wall, 3 feet apart in the row, and filled with concrete; 2 by 4 inch scantling were then placed on edge on these piers, level with the top of sill on wall. These 2x4's served to carry the floor, which is of matched lumber.

The rear studding are 4 feet high and 2 feet 6 inches apart. The front studding are 8 feet 10 inches high, and so placed as to allow for the 28-inch windows, also the 8-foot screened opening, which is divided into three sections, one section being readily removable to allow cleaning of building.

The height at peak of roof is 10 feet 6 inches, which allows the use of 7-foot rafters in front span of roof and 16-

foot rafters in rear span. Supports for roof are placed on the 10-foot line, and suitable bracing to strengthen roof and stiffen building are employed.

The rafters are 2 feet 6 inches apart, with 8-inch shiplap laid tight to carry the paper roofing. It was found that 16-foot shiplap cut nicely on the 2-foot 6-inch spaces, and allowed for the proper overhang without waste.

Dropsiding was used for sheeting, with building paper inside.

Miss Hunt keeps White Plymouth Rocks of the U. R. Fishel strain, and they have proved to be an ideal dual purpose fowl for her. She takes a keen personal interest in her poultry and has done very well indeed. The eggs gathered from her flock during 1920, which numbered about 205 birds that year, were as follows:

January	46 doz. and	3 eggs
February	86 doz. and	8 eggs
March	163 doz. and	3 eggs
April	239 doz. and	6 eggs
May	287 doz.	
June	178 doz. and	11 eggs
July	187 doz. and	4 eggs
August	171 doz. and	10 eggs
September	146 doz. and	6 eggs
October	83 doz. and	8 eggs
November	35 doz. and	1 eggs
December	35 doz. and	9 eggs

Total.....1,661 doz. and 9 eggs

Of this number, about 64 dozens were used in the incubators and 1,464 dozens were sold at an average of 46 cents. The flock averaged about 8 dozen eggs per hen. At an average selling price of 46 cents per dozen, the flock earned \$3.68 per head.

A statement for the year of 1920 is as follows: The receipts from eggs sold

EGGS FOR HATCHING

My 1921 breeding pens are headed by the winning males at this show, and all the females shown at this National Poultry Show are being bred in these pens. Don't you want eggs from these winners?

I am in a position to furnish you eggs from 20 of the best matings of White Wyandottes in America for 1921. All the very best birds reared the past three years are in these matings. My 1921 illustrated, instructive, art catalog of AMERICA'S FINEST WHITE WYANDOTTES DESCRIBING THESE MATINGS IS WAIT-

1st Cockerel, Chicago.

ING FOR YOU AND YOUR WISEST ACT BEFORE BUYING EGGS FOR HATCHING is to send for my catalog and mating list.

QUALITY EGGS, \$5.00 per 15; \$9.50 per 30; \$14.00 per 50, and \$25.00 per 100. A limited number will be spared from the most special matings for \$8.00, \$10.00 and \$15.00 per 15.

Special for March and April. Choice, fully developed Cockerels, \$10.00, \$15.00, \$25.00, \$35.00 and \$50.00 each. Selected mated pens, male and four females, \$40.00, \$60.00, \$75.00 and \$100.00.

Baby Chicks

"HALLWORTHY" HATCHED
From Selected Heavy Laying Flocks

amounted to \$673.39. Poultry sold, \$22.50. Eggs for table, \$52. Poultry for table, \$30. Gain in inventory from 205 White Plymouth Rock females to 285 females, \$120. Total for the year, \$897.89.

During January, 1921, the 285 females produced 97 dozen, of which 66 dozen were sold at \$46.71. The yield in February, 1921, was 173 dozen, of which 137 dozen were sold for \$70.30. On March 1 one of the incubators was full of eggs and running.

The pullets in the new house have done exceedingly well. Miss Hunt plans to add another 20-foot unit to the house this summer. The west wall will be left

intact, but a door cut into it, and another house just like the first one added onto the end. The house will then be 40 by 20 feet.

The house has a board floor and it is as airy, bright and dry a poultry building as we have ever been in. No wonder Miss Hunt wants another unit just like it.

Curtains swing against the open spaces, but they have been let down very little the past winter.

Chickens breathe more air than most other animals. One thousand pounds of hens will breathe two and one-half times as much air as one thousand pounds live weight of horses, cattle or

men. While the open spaces, covered only in severe weather with porous cotton curtains, may look large, the in-pouring fresh air and sunlight are necessary to the maintenance of the maximum health of the flock.

Nothing short of maximum health is enough. Hens that are alive but not fully alive; hens in which the vital fire burns dimly, are not heavy layers; for the laying of eggs is a process by which the species are reproduced, and the big reproducer is the strong, healthy hen. She alone can consume the necessary quantity of feed for continued heavy egg production.

Once the right kind of a house is

FIRST PRIZE R-C RED COCKEREL

Rochester, January, 1921.

My matings for 1921 contain many of the best specimens of Rhode Island Reds in existence today. Not only do they include my famous winners at Boston, Rochester, Madison Square Garden and Kansas City, but the breeders that produced these winners.

These breeders last year produced for myself and customers the greatest array of show birds ever known in the annals of Rhode Island Red history, and are ready right now to furnish eggs that will produce the same quality for next season.

Not only have these birds been scientifically mated to excel in the production of show birds, but every bird in every mating has been Hoganized so that they may excel in the production of heavy laying stock. The reports of my customers throughout the country prove that there is more Rhode Island Red quality produced from Tompkins Hatching Eggs than from any other.

Don't waste another season. Send for mating list and place your order at once.

Rats Kill

Baby Chicks

You experienced poultrymen don't need to be told what damage rats do. One man lost one-third of his brood of baby chicks. Traps, as you know, catch only an occasional rat. They breed ten times faster than you can catch them. Here is a new way that

Kills Rats Like Magic

Wonderful new French Scientific discovery now offered for the first time! Destroys rats and mice like magic. Simplest method ever devised. Absolutely effective. One application clears entire place of rats. Not a poison.

Dont' Risk Deadly Poisons

Never again risk using rat poisons on your place. How many children have died that way? How many dogs, cats or chickens!? Reefer's Rat Virus cannot harm any bird, or human, nor any animal, except rats and mice. Children can eat it without harm. The triumph of science over old time methods. Safe! Sure!

Rats Flee in Terror and Die Outside

Positively magic in its effect on every rat on your place. Terror spreads among them. They flee outside and die. No odor. No dead rats to handle. No live rats to kill.

Positive Guarantee

One application of Reefer's Rat Virus will clear your place of rats in a short time or your money back. What greater proof could you ask? If there is any chance, we take it!

Mail Coupon Now!

Don't delay another day. Clear your place of rats before baby chick season comes. For \$1.00 we'll send you enough Reefer's Rat Virus to clear a big poultry house, barn or yard of rats. Send coupon today—right now. The money back guarantee protects you fully. You take no chance. Mail coupon before you do another thing.

I accept your offer. Enclosed find \$1.00 for one package of Reefer's Rat Virus. You agree to refund my money if I'm not 100 per cent satisfied.

Name

Address

provided, the feed has an important bearing on health and production. The 285 White Plymouth Rock females and ten males on the Hunt farm receive 23 pounds of oats in the morning. "It is a generally accepted opinion that hens like corn better than oats, but our birds this year have liked oats better than corn," said Miss Hunt.

At noon the fowls receive a scratch feed composed of 5 pounds crushed oats, 8 pounds of cracked corn, 8 pounds of commercial scratch feed and 2 pounds of whole wheat. Miss Hunt would like to increase the proportion of wheat a little, but wheat has not declined in price as much as other farm grains, and farmers find it more profitable to sell their high priced grains and utilize their low priced grains.

The evening meal consists of 26 pounds of whole corn. The cost of this day's grain ration at Illinois farmers' prices for grain, is 33 cents for the 28 pounds of oats, 40 cents for the 32 pounds of corn, and 32 cents for the 10 pounds of commercial scratch feed and wheat, a total of \$1.05 for the day's rations.

Against this the hens were laying about nine dozen eggs a day the first of March, and these were being shipped to Chicago at 40 cents a dozen. The local price in Grundy county was 30 cents, and where a private trade was catered to in Morris, the county seat, the price was 35 cents a dozen.

Miss Hunt has developed her own egg marketing plan. The eggs are shipped to private customers in Chicago by parcel post in six, nine and twelve dozen crates. These crates are boxes that are made on the farm, and fillers are used that hold one dozen eggs each. The fillers cost about 1½ cents each. In the last twenty cases shipped to Chicago there has not been a single broken egg.

Miss Hunt guarantees her eggs to be fresh, and graded for good size and firm shells. No stale, off-shaped, small eggs or leakers are shipped. The price per dozen that she receives is governed by the wholesale market for "extras" as quoted daily in the Chicago papers. This is the highest grade of eggs received on the Chicago market. Miss Hunt charges 2 cents less than the top Chicago price, but the customer must pay the postage on the package, less the return postage on the empty case. In each case is enclosed a gummed slip having return address printed thereon.

Where does this flock of White Plymouth Rocks get the necessary animal protein to enable the hens to produce eggs in the winter? The answer is: from milk. The Hunts keep three cows; Caisley keeps five. There are few fall pigs farrowed in this section of Illinois, to consume the milk. The section is outside of the Chicago milk producing district; therefore the average farmer runs his milk through a separator and the cream is sold, or the farmer makes butter. The result is that almost any one of these folks can fill a 10-quart pail with skimmed milk every morning and set it in their hen house so that the birds can have all of it they want.

Both the Caisleys and Hunts supply plenty of bright alfalfa for their chickens to eat. For one thing, this makes the yolks yellow.

It is well known that alfalfa leaves have a high protein content, about 23 percent. It may be well, however, to

point out that this is vegetable protein, and the egg laying hen craves and requires animal protein. When animal protein is furnished in the form of meat scraps, tankage or milk, the hen can utilize the vegetable protein also; but a ration that is high in protein, and derives its high percentage from soybean meal, peanut meal or any other plant product that is high in protein, will be found to be a poor egg making ration regardless of its apparently satisfactory analysis.

An animal protein supplement increases the efficiency of all the other grains and meals in the ration. The hens that receive it are enabled to consume more feed and produce more eggs.

It was found at the Missouri Agricultural Station that it took nearly nine pounds of feed to produce one pound of eggs, when no animal protein was provided to balance the ration; but when the animal protein was provided it took four and one-half pounds of feed to produce one pound of eggs.

While animal protein is frequently the most expensive addition to the ration, it is economy to feed it. At the Missouri station it cost 22 cents to produce a dozen eggs without it, and 12 cents a dozen to produce eggs with it, after the expensive animal protein had been bought and paid for.

One of the principal merits of mash feeds is that they contain animal protein. It is this that has made it impossible to keep their selling prices in direct line with the downward trend of the grain and mill feed market. The price of mash feeds is influenced to considerable extent by the prevailing wholesale quotations on meat scrap.

Miss Hunt does not set the eggs of pullets for hatching purposes. She has a flock of big, typical White Rock hens, two and three years old, that produce the eggs for incubation. They do not lay as well as the pullets, but their eggs are larger; their eggs rarely hatch as well as those from pullets, but they produce bigger bodied, stockier legged chicks.

The chick situation almost put Miss Hunt out of business two years ago. The way the chicks did not grow was highly discouraging, and Advisor Longmire got in touch with a poultry specialist at the state college of agriculture and had him observe the situation for the purpose of suggesting a remedy.

This poultryman found that the chicks had age but lacked size. Their bodies were short. The chicks drank a great deal of water, had poor appetites, and were continually eating dirt. They grew light in weight and there were deaths each day. There was no diarrhea.

After observing this condition, the poultryman said that there was undoubtedly a diminution of red blood corpuscles in the chicks; that the disease was probably infectious leukemia, a disease usually credited only to mature birds, but reported by Salmon as affecting chicks. He further stated that he could prescribe no remedy and the only solution was to grow the chicks on a fresh piece of ground.

It is too commonly supposed that a quarter's worth of concoction from a drug store will cure a malady, if only the right dope can be prescribed. Moreover, it is something of a criticism to say that the origin of a disease is in filth and that the disease is a filth dis-

Easy to Tell a Real From a Fake

The real REPEATS—the fake don't. People PRAISE the real—they curse the fake. Here is a REAL Egg Producer and Flesh Builder, called "OCULUM." Only one drop a day, per hen, in the feed, makes hens "Shell Out" the eggs. It repeats and its users praise it. It commands respect in Salem, Va., its home.

Hawkins, Fishel, Latham and other national leaders call it "Liquid Gold," etc.

This Journal O. K's it. The Baltimore Sun says: "OCULUM" is a wonderful medicine and highly recommended. "OCULUM" made 48 hens jump from 8 to 42 eggs a day. H. C. Miller, Akron, O. Judge A. P. Assn. "OCULUM" cures when all else fails. For 15 years it has turned thousands of sick fowls and animals into "Money Makers."

It puts "Pep" in roosters and growth in chicks. Could not you "Make More" by using it?

Bottles 50c and \$1, postpaid. Trial bottle 10c. Agents wanted.

Money back guarantee. Free booklet tells all about it. Dealers handle.

ease. But Miss Hunt is a sensible woman, and she was quick to understand that ground on which chicks had been grown by her family for 47 years had reached the point of contamination.

So the colony house was moved 20 rods and the chicks were grown on fresh ground last year, and a splendid lot of pullets were developed.

All of the chicks are brooded in one colony house, which is 8 feet deep and 16 feet long. It is divided by wire netting into two pens, each 8 feet square. A coal-burning hover is operated in one pen, and as the birds develop they are moved over and a new hatch put on the heater side.

Advisor Longmire takes a measure of pride in the successes of the Hunts and Caisleys, and the several others in his county who have built new farm poultry houses and are caring for their flocks along up-to-date lines. Last fall

Colony House for Chicks Used by
 Miss Millie Hunt.

he held a culling demonstration on the Caisley farm, and all those who attended had an opportunity to inspect the new red poultry house.

In these farms he has poultry demonstration farms in different parts of his county. They are practical examples of what any farmer can do—and they point the way how to proceed to do it. They are the beginning of increased poultry interest and greater poultry profits in Grundy county.

Mr. Longmire is also interested in the kind of poultry that is to be kept in these good houses and is to receive the good feed and care. To encourage an interest in better stock, he was instrumental in organizing a local poultry show association.

The first show a year ago contained 200 birds. The show this past winter cooped 448 birds, so many birds, in fact, that they were "nearly crowded out of the building." The third annual show will be held this coming winter.

Having started the poultry work and organized it from the ground up, he has now turned the work over to his assistant farm advisor, W. Lloyd Keepers. He himself is tackling other problems.

That is what we call constructive farm agent work. There is nothing flashy or superficial about it. It is as fundamental as knowledge and honesty and hard work are fundamental—and there are no other things in this life that form a better foundation for permanent success, although some, unfortunately, do not want to deal with such hard factors.

CURRENT NOTES AND COMMENT

A. P. A. to Meet in Seattle.

By vote of the board of directors of the American Poultry Association the next annual convention will be held in Seattle, Wash., the second week in August, 1921.

Seattle has offered to pay the traveling expenses of the officers, and it is reported that special railroad rates will be granted to members who attend the meeting.

The vote for Seattle was 7; for Knoxville, 2; for Cedar Point, 1.

It was voted at the Buffalo meeting of the committee of forty to present an amendment to the constitution which, if adopted at the Seattle convention, will place back into the hands of the entire membership the privilege of selecting, by popular vote, the annual convention city.

* * *

Committee of Forty Meets.

The committee of forty, appointed at the last meeting of the American Poultry Association, held its third meeting at the Hotel Statler, Buffalo, N. Y. The sessions lasted throughout the three days of March 15, 16 and 17, 1921. Two of the evening sessions were not adjourned until well after midnight.

The proceedings of the first meeting held in New York City early in November, and the one held in Chicago during the Coliseum Show, were not reported in the poultry press.

Full reports of the actions taken at the first two meetings were submitted at the Buffalo meeting, and final action taken.

Thomas E. Quisenberry, secretary of the committee, was authorized to prepare a complete report of the Buffalo meeting for publication, and we print Mr. Quisenberry's report entire in this issue of the Journal.

No other meeting of the committee of forty will be held before the Seattle convention, and the Buffalo report will come up for adoption or rejection, in whole or part, by the association at Seattle.

The exact wording of the resolutions that were adopted at Buffalo are not to be printed, it being held that the resolutions should first be presented to the American Poultry Association, which created the committee of forty. Editors, however, are authorized to give the substance of these resolutions and explain their meaning. We therefore anticipate considerable discussion of the important matters in the Journal, and will avail ourselves of the editorial privilege of discussing these matters in a way that will leave no doubt as to the position of American Poultry Journal. As groundwork for this discussion, we suggest that breeders read Mr. Quisenberry's report in this issue.

The meeting was well attended, regardless of the fact that breeders were obliged to leave their farms in the hatching season. One breeder lost the sale, by wire, of a male at \$100 and four females at \$25, because he was not home to pick out the birds.

Lyle Funk, big farmer and live stock man of Illinois, who represented the committee on changes in the Leghorn Standard, paid a tribute to the high tone and character of the entire session by saying: "I have attended many meetings of live stock associations, but I would have missed more than I could have realized if I had not come to Buffalo. I have never seen such loyalty of men in sacrificing many things at home to come here, nor have I ever heard such earnestness of discussion."

The resolutions approved at Buffalo are far-reaching in their importance. The new program outlined is the most radical and revolutionary in the history of Standardbred poultry in America. Breeders should be interested in Mr. Quisenberry's report and the editorial discussion that is sure to follow.

* * *

The Tariff.

As predicted in the Journal last month, the Fordney emergency tariff bill was passed by Congress. It was a bill designed as immediate protection for American agricultural interests. One of the last acts of President Wilson was to veto this bill. He explained his veto by saying that "What the farmer now needs is a larger foreign market for his surplus product," and "We cannot sell where we do not buy." The bill failed to pass over the president's veto and is now dead.

A new executive has since been inaugurated, and tariff legislation looms up as one of the important problems to be solved by the new administration. President Harding agrees with his predecessor in that increased participation in the world's trade is important to the prosperity of the United States.

This question of tariff may be temporarily sidetracked until world trade conditions steady themselves a little more; and it may be that the first question to be taken up by the new Congress, to be called in session early in April, will be the question of revision of existing tax laws which appear to be interfering with business prosperity.

That agriculture will be given equal consideration with industry, when the tariff does come up in Congress, is prophesied in the following words of President Harding:

I believe in the self-sustaining, independent, self-reliant nation, agriculturally, industrially and politically. We are then guarantors of our own security, and are equal to the task.

MAMMOTH BRONZE TURKEYS—1st and 5th young toms, 2d and 4th old toms, 1st and 3d hens and 2d pullet, Chicago Coliseum, 1920, and a hundred more good ones. A thousand White Leghorn Breeding Hens (Selected Egg Layers).

Stock, Eggs and Baby Chicks For Sale. Mating List Jan. 15, '21

Influence of the Male.

After a pen is mated the eggs laid by the females show satisfactory hatching qualities after a period of two weeks.

After the male is removed from the breeding pen the eggs will continue to be fertile for several days, but fewer and fewer eggs are fertile after the male has been removed for a week. An occasional egg may show fertility for as long a period as 21 days.

When birds have been running in a mixed flock and a mating is made, the eggs may be saved for hatching purposes after a period of two weeks. When pens are mixed by accident it is necessary for two weeks to elapse before again saving eggs for hatching purposes. This wait of two weeks is long enough for practical purposes, however, an occasional egg may show the effect of a previous mating for as long a period as three weeks.

That a male may influence the progeny of a hen for a whole season, even though she has been put in a breeding yard and kept mated to another male, is a theory that is discredited by practical breeders. This is scientifically known as *telegony*, which means "influence of previous impregnation." Science also disproves the possibility of an influence of the male upon the female in such a way as to affect future offspring by other sires.

* * *

Slate Undercolor.

In the Silver Penciled and Silver Laced males especially, the requirement of slate undercolor is something of a handicap. There are so many other points that are of primary importance in giving beauty to the Silver males that breeders must occasionally allow their attention to be diverted from the one point of undercolor alone. Yet, because undercolor appears as a Standard requirement in the description of neck, back, breast and body, a critical judge may pronounce a bird faulty in four sections because the breeder relaxed a little on sound undercolor to make an advancement in some other direction.

We were glad to chronicle in the Boston Show report that the rejuvenated Dark Brahmas, which made such an imposing showing in Mechanics Hall, were judged on the basis of size, type and surface color. The judge evidently wanted a chicken first, a bird of type, Standard size and beautiful to look at.

What is the purpose of color in the under plumage, anyway? Should not undercolor be subservient to surface color? Consider the wild birds, those marvels of the alchemy of nature, whose surface color is painted with the brush of a Master Hand, and whose undercolor serves in subordination, to help forward and promote the perfection of the surface color.

* * *

Back Where Greystone Champion Was Bred.

Frank H. Davey is now located at Greystone Farms, New York state, where he was breeding White Rocks ten years ago when Mr. Owen bought the entire Greystone flock and engaged the services of Frank Davey.

Mr. Davey is therefore back on the old stamping ground where he made his early reputation, and is breeding his old favorites, the Silver and White Wyandottes, and the White Plymouth Rocks. He has recently added a strong stud of S. C. White Leghorns.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I would like information as to what variety of plums to raise in southeast Wisconsin? We have fifteen Hansen plum trees—they are wonderful fruit. I intend to plant some Wanetas. Note what you say as to Gold plums. I hear they are hardy at Madison, 200 miles northwest of us. I have heard that some plums were grown on peach stock and were not hardy. Kindly give us some information if you can; also how would the Bradshaw, Omaha, Terry Pond, Coes, Golden Drop do here? We can grow Grimes' Golden, York, Imperial, Spitzenburg apples and many varieties that can not grow further north. Have thirteen different varieties of pears. Is Diploma the largest currant, and Industry the largest gooseberry?

Wisconsin. Dawson Bros.

There are some plums propagated on peach roots, which, of course, are not suited to planting outside peach growing sections.

If you want to be sure of a crop of plums every year, plant the Hansen hybrids. Or, better yet for your location, confine your planting to Omaha, Terry, Surprise and Wyant. Diploma is the largest currant, and Industry a very large gooseberry. You will find the Oregon Champion the most profitable gooseberry for commercial purposes.

* * *

A short time ago when glancing over a magazine (I think the Scientific American), I noticed a piece in regards peat ground in the State of New Jersey being used as fertilizer. Did not give the subject much thought until lately and now am unable to locate a magazine containing article.

As I remember, through hasty reading, through the Government, a plant had been erected to dry and make use of this peat land on account of its value as a soil enricher for worn-out land and made it possible to raise good crops on land of mostly clay soil.

Perhaps you have read something in regards to this and can give information as to the value, where one can purchase it, etc.

Georgia. H. A. Good.

There are in several states large peat beds. This is decayed vegetable matter and of course is a good fertilizer when properly used. I have no knowledge of the government acting as you understand it has in this matter. I do not think it has or will so act. Write the Department of Agriculture at Washington, D. C., for information.

* * *

I am interested in Huron County, Mich. Will you tell me about this country; also what prospects there would be for a commercial apple orchard. I am interested in the Delicious; would this do well there? If not, what kind would you plant? The country seems to be flat, although they seem to have fair drainage. The country is around Kinde, Mich.

Wisconsin. T. J. Kondelka.

Huron county, Michigan is not well adapted to commercial apple raising. I would not put out a commercial orchard there. The Delicious is a wonderful apple. I would have a family orchard, were I in Huron county. Would plant Delicious, Wealthy, Duchess and Patton's Greening.

* * *

I can get land in Missouri cheap, also North Carolina. The land is cheap. I figure on getting twenty or twenty-five acres, raising poultry, fruit and some garden truck. I am a married man, wife and three-year-old boy. My wife has had a cough for about three years, and it is worse in winter. We lived in New Mexico, but it didn't seem to stop her cough—it was about the same. Do

you think western North Carolina would help her any? How is that climate? I have heard that Tyron, Hickory and Hendersonville were fine places for throat or chest trouble. Is the land around Hickory or Tyron good land, and what markets would be the best? Any advice you can give me on this I assure you will be highly appreciated. Is land around western North Carolina very high, and what kind of soil is it? Do you think it a good country for poultry and fruit?

G. A. Sanford.

Kansas. Western North Carolina, "the land of the sky," is a wonderful country—beautiful and productive. The climate is ideal. It is helpful to persons afflicted as in your case. The country around the towns you name is especially adapted to the production of grapes and apples, the vineyards being considered the most profitable. Land is comparatively cheap there. I advise you to make an inspection of this section at once. The soil is a mountain ash and this section is well adapted to the profitable raising of poultry.

* * *

I have a piece of land in view in Izard County, Ark.; there are eighty acres and can be bought for less than \$1,000. Can there be anything wrong with this land, it being so cheap? Do you know how this land lays in this county?; and how is it for poultry?; and how is the markets in that section? I would thank you for what information you can give me.

Oklahoma. B. Chance.

I cannot give you any information as to this identical piece of land. It is offered too cheap, it would seem to me. Do not buy this or any other land until you have inspected same. This county contains no apple orchards of commercial importance. Market facilities are not of the best.

* * *

I have about two acres of prairie black loam land which I wish to plant to raspberries. The land is well tile drained. This land is near the city of Fort Dodge, Iowa. What kind of raspberries would be best suited for this location for general and commercial purposes, when and how should they be planted and future care for best results? Where can I get stock for planting and probable price per 100?

Iowa. A. J. Wilde.

Plant Cumberland and Royal Purple raspberries. They should be planted in the spring in rows six feet apart, with plants three feet apart in rows. You can secure plants of any reliable nurseryman. Consult pages of American Poultry Journal.

* * *

Would like your opinion on Southern Texas. I have purchased ten acres of irrigated land in the Rio Grande valley in Hidalgo County.

Expect to set out an orchard of grape fruit and to work vegetables until the orchard is bearing. Can you give me any information on poultry in this locality, whether they can be raised successfully and whether there is a market for eggs and poultry?

Pennsylvania. H. A. Mahaffey.

Poultry in the section to which you refer is now being given considerable attention. The citrus fruit growers find that the poultry manure is a great factor in the growth of the trees, and the fruit and poultry combination thus is a profitable one. The market facilities for shipping are good and the local market is fair.

Bees for Profit

Make big money with little work. Small expense to start. Bees find own food. Honey brings good prices. We buy all you can spare. Bees are easily kept and cared for.

The Root Way Pays

Our special hives give winter and summer protection. We've made complete line of Beekeepers' supplies for 50 years. Tell us your occupation and whether you keep bees now. This helps us help you. "DANDY" BONE CUTTER

You needn't pay one penny for this bone cutter until you try it and it satisfies you. Feeding green bone is one of the first steps to gain a big egg yield. But the bone must be cut right. The Dandy Green Bone Cutter cuts across the grain of the bone, enabling the hen to digest the nutritive elements better and convert same into eggs, blood, feathers. Our terms on the Dandy Bone Cutter are:

No Money in Advance—15 Days Free Trial

The Dandy costs less than most bone cutters and it works infinitely better. Also cuts meat, vegetables, roots, etc. To ensure big sales this year we have made special reduction in prices. Write quickly for free booklet. Prices are liable to rise next month, owing to big demand for raw material. **STRATTON MFG. CO., Dept. G, ERIE, PA.**

What do you think of Willcox and Sulphur Springs valley of Arizona?

I have been thinking of moving and was undecided about this part of Arizona or the southern part of Idaho, around Twin Falls, Idaho.

I would want to raise poultry, bees and fruit, but chickens for the main object.

What would be the objections, if any, to either place?

What of the heat in Arizona, also as to market conditions? What of soil for my object in view?

Also what would you say of Idaho and the possibilities as to soil and climate, etc.?

Which is the best climate for a person who has always lived in a high altitude of Wyoming of 4,000 to 5,000 feet; also the best climate for rheumatism.

If there are any objections to these places which I have not asked about, please state in your reply.

Wyoming.

Mrs. C. E. Metz.

For fruit and poultry raising, the Twin Falls section of Idaho is far better than the Willcox and Sulphur Springs valley of Arizona. The Twin Falls section is one of the finest fruit and poultry sections of the whole country. The soil is a sandy loam. The market facilities are good, far better than afforded producers in the Arizona section to which you refer. You will make no mistake in locating in the Twin Falls section.

* * *

I have read recently of a new potato originated by Luther Burbank, and I believe, called the Burbank potato. This potato I have never seen advertised for sale in any of the seed catalogs, and I wondered whether or not it could be obtained for seed, and if so, where?

C. R. MacCarrick.

Massachusetts.

The Burbank potato is a very heavy yielder and one of good quality and a fair keeper. It is largely planted in the midwest. I feed sure you can get seed potatoes of this variety of many seedsmen in the east. If not you can secure it from the Vaughan seed store, Chicago, Ill.

* * *

Would you kindly tell me what you think of the southern part of Erie County, New York, for fruit raising? I have the offer of a place, sandy loam, rather rolling, sloping west. Could I raise apples, pears and grapes? Is the climate too cold for peaches? Local men say it is, but it is almost universally a dairying district with a small, neglected home orchard of a few apple trees. I wondered if it had been tried. What varieties would you recommend?

S. A. Reed.

Ontario.

Erie county, New York, is not in the fruit belt proper. I would not plant a peach orchard there. For this, I would secure land just south of Lake Ontario, in New York. You could raise apples, pears and plums in Erie county, but I would not think of attempting to do so there in a commercial way. Do not ever attempt to buck nature. If you desire to raise fruit commercially, go where nature has given you all conditions favorable to fruit raising.

* * *

I have a nice little place in town and am trying to get it set to fruit. We are located directly east of Keokuk, Iowa—18 miles. The soil is deep black soil with a clay subsoil, inclined to be a little wet. I have purchased the best quality trees from Stark Bros., but cannot get them to live. We have had three very dry summers in succession and my neighbors say that is the reason they die. What I now have living are not healthy looking, are affected with San Jose scale and have never been pruned, only had the tops cut back. Can you give me directions for pruning and is lime sulphur better than scalecide to spray with? I have an acetylene light plant and some say the residue from it is good to spray trees with. Can you tell me of some book that is good for an amateur gardener? I want to get the very most, best and earliest vegetables from a small plot of ground.

I have a plot 15x50 that I expect to put in

TRY THE NEW WAY TO KILL LICE

**NO DUSTING
NO DIPPING**

**NO PAINTING
HANG UP THE BOTTLE**

A hen worried to death with lice can't lay if she wants to, but she eats just the same. You might as well "throw money to the birds," as feed high priced food to lousy chickens. It's a dead loss—don't do it.

Licecil

Kills Lice

Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

READ THE EVIDENCE

IF YOU have never used Licecil and are inclined to doubt the claims made for it, just consider the letters which appear on this page. These testimonials are but a few of the hundreds that are continually coming in from satisfied customers from all parts of the U. S.

KEEPS ON USING LICECIL

Please find check for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.
J. D. ALLEN, Lynchburg, Va.

IT DOES THE WORK

I have used the three bottles of Licecil according to directions. It did the work all right.
OSCAR THOMPSON,
Long Beach, California.

WANTS MORE

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now.
JOHN HOLTRAP,
Lynden, Washington.

VERY EFFECTIVE

Received shipment of Licecil, which I have divided with some of my friends. We have found it very effective.
HANS EYERSEN, Silver Creek, N. J.

PLEASED WITH RESULTS

Received Licecil sometime ago and am well pleased with results. Expect to use it continually hereafter.
FRED S. WILLIS,
Wyandotte, Michigan.

LARGER ORDERS

Enclosed find \$5 for six bottles of Licecil. Kindly rush this along and oblige. One of your satisfied customers.
EDWARD LEHR, Escanaba, Michigan.

REORDERS

I enclose \$2.50 for which please send me Licecil. I found Licecil very much better than anything I ever tried.
MRS. JOHN ANDERSON, Buford, Wyo.

KEEPS ON USING IT

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.
J. E. PLATT, Maywood, Ill.

THE BEST

I bot a bottle of Licecil from you some time ago and found it the best thing of the kind I ever used. Please send me another bottle for the enclosed.
MRS. L. M. JOHNSON,
Plumville, Pennsylvania.

LITTLE WORRY OR WORK

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.
BERNARD F. OSTERFIELD, Dayton Ohio.

SEND MORE

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.
L. G. STAYNOS,
Sherman, Texas.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

HOW TO USE LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in a mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

MONEY BACK IF IT FAILS.

1 Bottle \$1.00; 3 Bottles \$2.50; 12 Bottles \$9.00—All Prepaid.

AMERICAN SUPPLY CO.

QUINCY, ILLINOIS

KILL RATS

New Way by Science

HELP the U. S. Public Health Service in its great crusade to kill all the rats in the country. They cost \$180,000,000 a year, carry disease, spread plague. Rats rob average farmer of \$100 a year. What do they cost you? How much grain do they eat? How many baby chicks do they kill?

New Discovery

Not a Poison

REEFER'S RAT VIRUS is its name. Bacteriological concentrate discovered by noted French scientist. Prepared in Government Inspected Laboratory. Does away with all traps and poisons. Entirely different. Used world-over on ships, wharves, warehouses where rats are thickest. Sure death for every rat—absolutely harmless to everything else. Children can eat it as safely as jelly.

Guaranteed to Kill Every Rat on Your Place in SIX Days

Use REEFER'S RAT VIRUS and in 6 days every rat on your place will be gone—or your money back. What greater proof of its merit could you want? You don't have to suffer from rats any more. You can kill them SURE.

Rats Die Outside!

Always die outdoors seeking water. No rotting odor. No rats to kill. Only perfect rat killer invented. Approved by highest scientific authorities. Sure death—safe—simple to use

6-Day FREE Trial

Prove that your rats can be killed in 6 days without risk. Take advantage of this great offer. Fill out coupon. Use REEFER'S RAT VIRUS for 6 days. If there's a single rat left, your trial costs you nothing. Isn't that fair? Don't wait! Rats are costing you money every day you delay. Spread disease, cause fires—don't hesitate—accept this square-deal offer.

Don't Delay

Don't tolerate rats any longer. Fill out coupon and mail. For just \$1.00 we will send you enough Reefer's Rat Virus to clear a big barn or house of rats. Send for it! Try it! 6 days later, if there is a rat alive, you get your money back. Every rat killed means \$10 saved. Every living rat costs you \$10 a year. Get rid of every rat—here's your chance.

Mail This Coupon

E. J. Reefer,
I accept your offer. Enclosed find \$1.00 for one package of Reefer's Rat Virus. You agree to refund my money if I'm not 100 percent satisfied.

604 Main St.
Ventnor, N. J.

Name

Address

strawberries this spring. Would the ordinary kind or everbearing be best for home use? Please give me full instructions how to have the best patch.

Am enclosing self-addressed envelope and would like an answer at once as I would like to get the preliminary work done.

Iowa.
Fred P. Hull.

Your apple trees are dying because their feet are too wet. Also because of neglect. No man should allow San Jose scale to remain on his trees. Scalecide will rid trees of this pest very quickly and effectively. Scalecide is far superior to lime-sulphur. It will do all that lime-sulphur will do and much more. You should tile out this land. It is difficult to instruct one how to prune a tree unless one is on the ground. It cannot be done, except in a general way, and that fits no individual case. Do not use waste from your lighting plant as a spray material.

I advise you to plant Dunlap, Haveland, Sample, and Gibson strawberries. Do not plant the so-called everbearing strawberry.

The "Garden Book" and the "Apple Orchard" are books which would aid you. You can secure these from the American Fruit Grower, Chicago.

* * *

I have room for a town lot orchard of sixteen trees, by planting twelve feet apart each way. Is that far enough? I want one quince tree and one apricot tree as I have a sheltered spot for them; five apple, four peach, three pear and two plum. I would like to have all of different varieties in order to have a succession of each kind of fruit. The soil here is sandy and we have more or less drouth, but I have city water and could do some watering. Will you kindly advise me as to choice of varieties and age of trees?

These trees will be planted in my chicken runs (but there will be few chickens in the runs the first year). Would this create any difficulty in getting the trees started?

Kansas.
L. P. Turner.

Plant as follows: Orange and Van Leeman quince; Stella apricot; apples—Henry Clay, Duchess, Wealthy, Grimes Golden, Delicious; peaches—Early Elberta, Elberta, J. H. Hale, Krummel; pears—Lincoln, Seckel, Keifer, Garber; plums—Omaha and Terry.

Cleanliness.

Keep your poultry yards and pens clean; feed clean, wholesome food; raise clean poultry, and you will be more successful.

If your fowls live in filthy quarters, eat filthy food and breathe filthy air, they cannot be grown into beautiful, healthy birds. One of the secrets of successful poultry raising is cleanliness, and without it no material success can be had in raising poultry.

Treat your fowls the same as you would desire to be treated yourself. You would not expect to raise beautiful, healthy children by allowing them to live in filthy surroundings, eating filthy and impure food, and breathing filthy air—would you?

To raise beautiful birds with perfect plumage, body shape, carriage and action, requires care and cleanliness in everything. Good, strong, fertile eggs cannot be laid by hens that live in insanitary quarters and pick their food off a contaminated dirt floor that is damp in spring and sends contaminated dust into the air when dry. Eggs from such stock so kept will not hatch good, and those that do hatch will not produce red-blooded stock.

Clean poultry pens and houses and clean, wholesome food are necessary for success.

J. R. Hudson.

The Quality Line

For over 32 years, thousands and thousands of poultry raisers attribute much of their success to the use of International Poultry Food Tonic. It helps make hens lay wonderfully well and keeps poultry in the best of condition.

INTERNATIONAL Poultry Preparations

The line includes every preparation necessary to the promotion of good health, proper growth and development of all kinds of poultry.

International Stock Food Co.

How to Prevent Chick Losses.

(Continued from page 449)

condition known as leg weakness. This commonly develops in chicks that are apparently healthy and growing rapidly and its cause has been the subject of much speculation among poultry keepers in the past. The condition has been variously ascribed to the lack of certain elements in the ration, limited exercise, too high temperatures, and several other factors. It has long been known that giving the chicks free range on the ground prevented the development of the trouble and cured the chicks that were not in advanced stages.

Recent investigations at the University of Wisconsin indicate that leg weakness is primarily a digestive trouble and that the condition develops due to the poor elimination of waste from the body of the chick under conditions of confinement. According to these investigations the specific cause of leg weakness appears to be the lack of inert material in the ration to eliminate the body waste. These experiments showed that baby chicks when given an opportunity will eat relatively large quantities of fresh earth and where they have access to such material leg weakness does not develop, due presumably to the fact that the inert material eaten helps to keep the digestive tract clean.

The findings of these experiments simply emphasize the importance of getting the chicks on the ground as early as possible. Where weather conditions will not permit of the chicks having free range during the early weeks of the brooding period, leg weakness can be prevented by placing fresh dirt in the house for the chicks to eat. Many successful poultry keepers handle this by taking up pieces of thick sod and placing these in the brooder house. For the first day the grass side of the sod is turned up and the chicks are allowed to eat the green stuff. Then when this is gone the piece is turned over and the chicks have access to the roots of the plants and as much fresh earth as they need.

One especially annoying chick trouble that often causes serious losses on plants where poultry has been raised on the same land for a number of years is gapes. Gapes is not strictly speaking a disease, but the peculiar gaping that gives the name to the trouble is caused by a small parasite worm that becomes lodged in the windpipe of the chick. This worm lives over in the soil from year to year, and when the trouble once gets started it is very likely to infest practically the whole flock and result in the death of many chicks and the serious stunting of a majority of those that contract the trouble.

Treatment of the individual chick after it contracts the gapes is seldom successful. The trouble can be prevented by raising chicks on soil that has not been previously used within three years for growing chicks or by keeping the chicks off the ground until they are three or four weeks of age. If the chicks are kept on a board floor, or otherwise kept off of soil that is infested with the parasite, until the chicks are three weeks of age they are apparently able to throw off the

Start Chicks Right—Hurry 'em Along

There's no profit in scrawny, runty, undeveloped chickens. Don't waste time on them. Keep your chicks growing from the day they hatch until they go to market or begin laying. It's the quick-grown table birds that bring the high prices—the vigorous, fully-developed pullets that make the steady layers—the big boned, full-muscled cockerels that are worth-while breeders. These you will get if you feed "the Pratt way." The scales will prove it.

Pratts Buttermilk Baby Chick Food

should be fed from the very first meal and during the first four to six weeks—that most critical time. Pratts is the original "baby food for baby chicks." Gives chicks a strong start in life—builds bone, muscle and feather—makes for vigorous growth and even development—helps keep away the common chick diseases. It contains the needed buttermilk and the other essential food elements which keep the youngsters healthy and make them grow.

Pratts Poultry Regulator

should be included in the coarser regular ration when the youngsters are large enough to receive the latter. This great poultry tonic and conditioner—the favorite of successful, money-making poultry men for nearly fifty years—helps to maintain the vigor and vitality of the youngsters and hurries them to profitable maturity. Pratts Buttermilk Baby Chick Food and Pratts Poultry Regulator are sold everywhere under the square-deal Pratt guarantee—

ORIGINATORS of all the Orpingtons

RECOGNIZED HEADQUARTERS for the Best Orpingtons, all varieties, and the largest poultry breeders in the world.

SEND for our new CATALOG with history of all the Orpingtons.

EGGS—You will find our eggs an excellent investment. As we MADE all of the Orpingtons it is natural we know how to MATE for the best results. Our customers get the benefit of this knowledge, and are sure of the best and purest blood from us.

Safe delivery and SATISFACTION GUARANTEED, and backed by our reputation of 48 years. We have won over FIFTEEN THOUSAND FIRST prizes and numerous government-laying contests, showing our birds combine quality with usefulness.

Several thousand stock birds for sale. Advice free. Ornamental and song birds for sale.

WHITE DIARRHEA

A PERFECT HATCH! THEN WHAT?

Will you save every chick, or shall WHITE DIARRHEA get them? This contagious germ disease causes greater loss than all other poultry diseases combined. In infected flock the loss varies from 50 to 80 per cent of the chicks hatched. Chicks that recover often remain stunted all their lives.

Stop this enormous loss. Raise every chick you hatch. No need to lose a single one. Raise them all. Keep them healthy and strong and growing fast.

"Giles" POULTRY-TONE is a safe and effective germicide for all bowel germ diseases. It combats the germs that cause white diarrhea and it tones up the system so the chicks can resist disease.

"Giles" POULTRY-TONE positively prevents White Diarrhea. For Chicks already affected, it affords prompt and permanent relief.

Send 20c for trial bottle. Enough to treat 12 chicks. Enough to prove its great efficiency. Larger bottle 50c; quart can, equals ten 50c bottles—\$2.50. Prepaid. Satisfaction guaranteed or money refunded. The season is here. Be prepared. Act now. Order today.

attack without any harmful effect. Brooder chicks are much less commonly attacked by gapes than are those raised by hens, due probably to the fact that brooder chicks usually do not get on to the ground as early as chicks with hens. Plowing and liming the soil where chicks have been raised will help to prevent the spread of gapes but the safest plan is to move the brooding yard to fresh soil each year, allowing at least three year intervals between the time that a particular piece of land is used for growing stock.

In many flocks heavy chick losses are caused by the attacks of lice and mites and this is a condition that can be easily remedied. In some sections lice are so bad on the chicks that some poultry keepers say in all seriousness that each baby chick is hatched with a louse on each side of its head. This is certainly an exaggeration but where the chicks are brooded with hens, the large head lice very quickly find their way to the chicks and if not controlled will cause serious losses.

Probably the most satisfactory treatment for lice with baby chicks is to thoroughly treat the setting hen with lice powder or sodium fluoride by the pinch method before the hatch comes off. One thorough application of the powder during the hatching period will keep the hen free from lice during most of the brooding period. Where the lice are found on the baby chicks the mother hen should be treated with the powder and a very small pinch placed on the head of each chick, and such treatment will eliminate the lice.

Mites are often troublesome with baby chicks where the brooding is done in coops that have been used as roosting quarters by other fowls. The loss from mites can be controlled by thoroughly painting the coops with crude oil before the chicks are put in them.

Set Live Eggs to Produce.

I am often asked at this season how many eggs one ought to set so as to make sure of getting a certain number of pullets. There are some authorities who contend that you cannot expect to raise to maturity one pullet for less than six eggs set. But I think that, with average good fortune and ability, one ought to be able to make five eggs sufficient.

Even that may seem rather an outside figure, but let us examine it and we shall find that it is none too many. We will suppose that our aim is a flock of fifty pullets. On the basis of five eggs a bird we must put down for incubation 250 eggs. Deduct from that number all losses in incubation and rearing, including infertile and candied eggs, up to, say the age of three months, and we shall reduce the original number by 50 percent, leaving 125 birds. One-half of these we must write off as cockerels, which will only leave us with a little more than sixty pullets. Of these we may still lose a few by accident or disease before the laying period begins, and there are always some wastrels to weed out during the final grading. Therefore, it will be seen that five eggs for a pullet is not so extravagant as it may have seemed at first thought.—Scottish Poultry News.

How to breed chicks successfully is perhaps one of the biggest problems which confronts the poultrymen during the next three or four months. Obviously one cannot hope to get a great many eggs, win a great many prizes in the showroom, produce the best sorts of fowls for table use, or do any other desirable thing with hens unless they are able to grow strong sturdy chicks.

Cosh's Barred Rocks

MAKE A SENSATIONAL WIN AT PHILADELPHIA, 1921. Winning in one of the largest and grandest classes of the entire season: Cocks, 1-2-3-4-5; hens, 1-2-3-5; cockerels, 1-2-3-4 (40 in class); pullets, 1-2-3-4; pens, 1-2; carrying all shape and color specials, including American Poultry Ass'n gold medal for champion cockerel in American Class. All sweepstake prizes in show, competed for, viz.: President's cup for best display in show; vice-president's cup, most points all varieties; Record cup, best display American Class.

This tremendous win is on a parallel with the victory achieved by our birds at Trenton last season; conclusive proof that our blood lines are right, and that Cosh's strain is the ideal for foundation or improvement of your present flock.

DEVELOPING A BUSINESS IN BABY CHICKS.

(Continued from page 450)

chickens were a source of dissatisfaction. To build a really big business she found it necessary to control her eggs.

Through the experience gained in the hatching of thousands of eggs of all breeds she knew that the White Leghorn eggs gave a higher percentage of fertility and hatched better. This, of course, meant more profits. The experimental stations had proved that the White Leghorn laid the eggs on somewhat less feed, so there was the greatest demand for this breed. She abandoned commercial hatching entirely, but two other women took it up, thus filling a neighborhood need, and devoted her whole business to selling White Leghorn baby chicks.

It is characteristic of the woman that she started in immediately to establish a flock of White Leghorns for herself. She bought locally 100 pullets of a known, proved strain. She then sent to Massachusetts for hatching eggs from a 230 trapnested strain. She has worked, developed, culled, increased this flock every day of every year since. She keeps 500 hens of her own and buys the entire output of 2,000 hens. She could not supply all of her own eggs, so she made a proposition to the ranchers which has proved profitable to all concerned.

The rancher buys the baby chicks from Mrs. Bundy. The pullet year the eggs are marketed as non-fertile eggs. The second year Mrs. Bundy furnishes the cockerels free from her own flock, one for each eighteen hens, and contracts to take all eggs from December 1 to July 7. All the flocks are under her direct supervision. She visits each flock every two weeks. All the birds are Hoganized. All are on free range. A separate record is kept of each flock. If any defect develops in the testing or hatching she knows just which flock is doing wrong and she goes right after the trouble.

The eggs are brought to the hatchery twice a week. The incubators are set half at a time, giving a hatching every Monday and Thursday. Last year 42,000 chicks were hatched; this year she expects 50,000. The business of selling White Leghorn day-old chicks has passed from the local stage and now extends into Arizona, west Texas, old Mexico, as well as the home state. Within the last year Mexico has developed into a profitable field. As yet the transportation facilities are of such an uncertain nature that baby chicks are not accepted for shipment, but pens and hatching eggs are in great demand. The laying qualities of Mrs. Bundy's home flock are widely known, resulting in profitable business in hatching eggs, cockerels, and pens of from two to fifteen birds.

It has never been possible to fill all the orders. She has unfortunately been forced to refuse several single orders for 10,000 chicks, knowing her limited capacity will not enable her to fill such large orders without disappointing her old customers. She has been working on her egg supply for three years. She expects to have enlarged it by next year so that she can double her incubator capacity.

Either directly or indirectly, Mrs. Bundy has been the moving spirit in

Chickens Do Their Best

only when they are guarded against disease, lice and mites. It is the poultry keeper that backs up correct feeding with proper sanitation who gets the best results from his flock. The use of

makes it certain that walls and other surfaces will be disease preventers and louse and mite destroyers instead of breeders of death and discomfort and lost profits.

Carbola is a white paint in powder form, combined with a powerful disinfectant, but neither caustic nor poisonous. Besides saving all the extra work necessary when disinfectant is put on over whitewash, Carbola does away with the waiting and straining, the sprayer-clogging, and the peeling and flaking that go with whitewash—and turns a disagreeable job into easy work, quickly done. Carbola is mixed in less than five minutes—just stir in water. It gives the wall a smooth, even coating of snowy whiteness and great disinfecting power. It makes buildings lighter, sweet-smelling and sanitary.

Use It Instead of Whitewash and Disinfectants

in stables, poultry houses, pig pens, cellars—wherever you have been using whitewash and disinfectants or just whitewash. Apply as you would whitewash—with brush or sprayer—to wood, stone, brick, cement, tar-paper or other surface, or over whitewash. A gallon (a pound of the powder) covers 200 square feet.

Also An Excellent Louse Powder

The Carbola powder is sure death to lice on the birds. Poultry keepers rub it into the feathers and sprinkle in the dust bath, in nests and litter. It costs half as much as other louse powders.

Your hardware, paint, drug, or seed dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express. Satisfaction, or money back.

10 lbs. (10 gals.) \$1.25 and postage. 20 lbs. (20 gals.) \$2.50 delivered. 50 lbs. (50 gals.) \$5.00 delivered.

all the poultry developments in the valley. Eggs are now only a side line with all the ranchers, but each year, as the possibilities of the industry are demonstrated more clearly, the ranchers are giving more time to their chickens and enlarging their flocks. This no doubt is the best policy, as no business depends more on experience than does the chicken business.

The profits are conclusive. Mrs. Bundy sold through the association 1,540 dozen eggs in one year from a pen of 110 pullets that netted her \$3.50 per pullet. She bought 1,739½ dozen eggs from one rancher in six months that were produced by 130 hens, at a net profit of \$5 per hen. The climate is unusually adapted for successful poultry raising. Sunshine and warm days all the year round keep the hens laying.

Four years ago only two ranchers shipped eggs, totaling about three cases a week. A poultry association formed three years ago with twelve members has grown to fifty members and sold \$27,000 worth of eggs in the three years. Last October, four associations—Poultry, Cabbage, Sweet Potato and Fruit—merged into the Farm Bureau Market Association, greatly reducing the overhead, thus boosting the profits. In January the association netted the members 60 cents per dozen for eggs. The market for chickens, turkeys and eggs knows no limit out here. Thousands of cases of eggs are shipped into El Paso, Texas, from Kansas. All of our production can be absorbed without affecting the market.

In talking of her business Mrs. Bundy said: "My work is restricted only by my physical limitations. If I could make 20 of myself I might be able to keep up with the demand for baby chicks. My idea of developing a dependable trade is to give customers only strong, vigorous chickens. I have established a standard that I shall maintain, even if I have to cut down my output. We do not have any trapnested birds, but our flocks are bred to lay. The culling out and the building up of the flocks requires more work and time than the hatching. Give me an unlimited supply of the right kind of eggs and the hatching will take care of itself."

Every egg that goes into the incubators is selected by herself. It must be the right size, shape and color. Regarding size, she has bred up her hens to lay such big eggs that only 72 can be set up in the standard 75-egg trays. The eggs are all hand-turned. The space under the eggs in the machines is filled with excelsior, as it was found there was too much ventilation for this climate. While she recommends hydrometers for all amateurs in this country, she regulates the supply of moisture by watching the air cell. Besides the moisture on the floor, pans of water are set under the eggs when needed. Her successful hatches are not only the result of the right kind of eggs, but the constant care and attention that she gives them.

Her office with its typewriter, modern system of bookkeeping, filing system; the methods she uses in buying her supplies; the attention to details in shipping; the care her correspondence receives, all prove that she is a woman of exceptional business ability. She mixes all her own feeds, buying by the ton at harvest time, locally. A local demand for poultry supplies resulted in her add-

BABY CHICKS

From selected S. C. White Leghorn hens on free range, mated to choice cockerels bred from Cornell certified stock with trapnest records of over 200 eggs.

Wm. H. Herring, Pleasant Valley, Dutchess County, P. O. Box No. 63 (Dept. "A") New York

ing the agency for incubators, brooders, baby chick feed in small packages, and other supplies as a side line.

From this modest beginning, in a few years Mrs. Bundy has developed the most profitable enterprise in the community. A new industry which is proving a great benefit to the valley has grown up through her success. Application and a willingness to work have been the determining factors, but independence of thought and confidence in her own judgment are outstanding characteristics. She never waits for someone to try out a venture. She leads.

The Silver Laced Wyandottes.

(Continued from page 451)

shipped me a pair from which the results have been beyond my greatest hope.

The importation was late and on the arrival of the birds they were not in good condition, yet I recognized immediately that if I could use them I would have fine results. The last week in May I was able to obtain eighteen chickens from two sittings of eggs, sired by the Philipson male mated to a few English blood females which I had owned previously.

I might add here that in my order I stated I wanted blocky birds, with American Wyandotte heads, as good flights as possible and black tails, and the wonderful black and white oval lacing. Apparently the order was filled to the "Queen's taste." I have recently seen the statement that the per-

Standard Laced Feather.

Defective Silver Laced Feather. White Marginal Edging Around the Black Band Is Called "Frosting." The Dark Penciling Appearing in the Center of the Feather Is Called "Mossiness." Both Are Common Defects.

centage of chickens from such matings might give a few good individuals, but on the whole would give inferior results. Of the eighteen chickens I hatched from the two sittings of eggs one was white, one male showed that he would be fine eating. Of the rest all were superior, so much so that the first and third pullets at Boston this winter were from this hatch, as were the pullets in the second young pen, same show. First and third pullets at Boston were second and third at New York, Madison Square Garden, two weeks later. Of the first pullet at Boston Judge Weed said in print, that "if there had been a special prize for the best Silver in the show, first pullet would have surely had it." Of the pullets from this mating that were not shown all were superior. The above success was most gratifying to me.

In all my years of breeding I have never seen stamped on the progeny of a mating such strong family characteristics as there were in these seventeen Silver Wyandottes that grew to maturity. A pleasing feature was that

Wilbur's Columbian Plymouth Rocks

FIRST PRIZE COCK
Madison Square Garden, New York, 1919

Winners at New York and Boston

Frank Platt, in American Poultry Journal, writes of my Boston exhibit: "Columbian Rocks show a pleasing advance over any class that heretofore has been shown. First, second, third, fourth and fifth cockerel free from brass, good quality birds and five better ones have not been shown by any breeder. First cock, a clean colored bird, good substance and nice type. The entire line has a sharp eye, pronounced in richness of color. These beautiful birds should make many new friends for they are well worthy of having."

FACTS TALK

And they are further evidenced by the report of the leading poultry papers. It is absolutely impossible for you to go wrong when you buy my practical, profitable and beautiful strain.

My Columbian Rocks are prolific layers of large uniformly well shaped eggs. The chicks are hardy and develop rapidly when given just ordinary care. Pullet's mature in from five to seven months.

Hatching Eggs, Layers and Breeding Stock

from my great prize winning strain, that I have for sale are all listed with price of each, in my 1921 illustrated circular and mating list, which contains many photos of my prize winners. Write today.

Wilbur Poultry Farm

Henry Wilbur, Prop.
104 Crandall Road, Tiverton, R. I.

W

they did not have so-called English snake heads, but good sized heads, a good breadth of comb, yet not coarse, and best of all they had splendid Wyandotte shape. Particularly what I was after was large oval centers with a real black edge. I obtained that.

America has been seeing open laced females for ten years or so. The centers more in line with those pictured in the Standard, but with such females we have seen "snake" heads, white, or nearly white primaries, and in type the birds were far from that of a Wyandotte. But the last few years has seen a vast improvement as to shape, heads and flights. I predict that in five years we will have eliminated the bad features to a much greater extent and that the winning females at our shows will have more than ever the beautiful Standard requirements as to lacing. The special for the best shaped female in the Silver class at the late New York show was won by one of my English bred females.

The question is often asked why double mate? Just this: the desired results can be obtained far more easily and quickly, especially as to lacing, and it is the lacing, plus shape, that really makes a good Silver Wyandotte. Then a point not often brought out is this, our purebred American Silvers are being bred with nice open centers, but not the beautiful oval centers. The American bred centers have more of a diamond point.

For the breeder who has only one pen, yet wishes to breed prize winners on a small scale I can see no reason for him to breed other than along the older, more conservative lines of single mating. But for the one who wishes to have more than one pen, why not, if he so desires, practice double mating.

As one breeds honestly and shows honestly who is to say that he shall or shall not use the double mating? The winning males and females in most of the big shows today are the result of the double mating.

No Standard Changes Recommended.

More or less agitation is going the rounds for a change in the Silver Wyandotte Standard, the idea being to state just what proportion of black and white shall make up the lacing. With most of the breeders with whom I come in contact, either personally or by letter, the idea is well fixed that we should leave the Standard alone and keep on breeding up to it. Certain it is that great improvements have been made in many quarters.

The season just closed has seen more and better Silver Wyandottes shown than ever before. By the co-operation of the breeders throughout the country more and better Silvers can be shown in the future.

There is no doubt of the respect in which Silver Wyandottes are held by the poultry fraternity everywhere. They only need the emphasis of breeders of their all around quality as regards both utility and beauty, that to obtain a winning specimen is no harder than with any other parti-colored fowl, that one can take his own method as to breeding and know that quality can be obtained by either method.

THE OLD RELIABLE LAMBERT'S DEATH TO LICE

Insures Clean Fowls—Larger Profits

It has been the Standard Lice-Killer for over 30 years—the standby of Successful Poultry-keepers. Easily used, absolutely safe, sure and quick in results. Most economical because it goes farthest. HANDLING THE BACK YARD FLOCK.

(Continued from page 453)

The dry mash hoppers are always open. But poultry doesn't like dry mash as well as the whole grains. When I turn the lights on and the hens are down on the first floor after the whole grain, I close the trapdoor and scrape the droppings. Before it is fairly light in winter the hens are out in the runway. Then I feed the sprouted oats—about seven or eight square inches. Then to the office. Time, not over twenty minutes.

Sprouted Oats.

While one would think that everybody knew all about sprouted oats, yet it is remarkable how many who have kept poultry for years know absolutely nothing of this valuable yet very inexpensive green food. Many have asked me for information. Most all those who have heard of sprouted oats seem to think they are grown in the ground and nothing but the green tops are fed.

Sprouted oats are nothing but dry, every-day seed oats, soaked in water and kept watered for some days until the oats sprout. No ground is used whatsoever. And you feed tops, roots and all.

You can make your own oats sprouter if you wish, and make it out of either wood or metal. The metal sprouter is better because it will not soak up the water and slime from the oats, and therefore will not mold when future batches are made. All it is, is a tray large enough to hold a layer of soaked oats about an inch and a half thick. You need no oil heater. If your cellar is even moderately warm and has just a little daylight, that will answer well. If not, any space in the kitchen will do. The tray is punched full of holes, small and close together, on the bottom, to allow the surplus moisture to escape. I use a purchased stack of four trays made of galvanized iron that you can purchase for a few dollars and which last many years.

I have two large salt bags. In one of these bags I place as much dry oats as will go into a 50-size empty cigar box. This just fills one of my trays after they start to sprout. Tie up the end of the bag with stout cord and allow all the space you can for the oats to swell. Let it soak in a bucket of water over night. The next morning I take out the bag and hang it on a nail over the bucket. During the day the oats begin to heat up and sprout. At night I duck the whole bag in the water again, after shaking the oats around, and again hang it up on the nail. This I do night and morning for four or five days. By then the sprouts have started. You'll see the little green ends sticking out of the oats. When this stage is reached, the oats are dumped out on the perforated tray and evenly spread out, watered night and morning until the sprouts are about two inches high, then fed.

The length of time you will have to use the bucket for sousing the oats in the bag will depend on the temperature of the place you have them. The more heat, the less time required. Do not let them get too much of a start in the salt bag, or your final sprouted oats will be hard and tough—just till the sprouts barely start. Always have enough pans of oats started so that when one pan is

The kiddies are delighted

Can you blame them? Look at those baskets filled to the very brim with big, beautiful, white eggs. Every egg represents the full day's work of a Sheppard's "Famous" Ancona. It's a lot of fun for the kiddies to gather the chalk-white harvest of eggs when Sheppard's "Famous" Anconas are "on the job." Even a comparatively small flock will keep your kiddies busy with the splendid, wholesome fun of "egg hunting."

Sheppard's "Famous" Anconas are a hardy breed. They don't demand the expert care of a specialist in order to produce eggs. They have the habit—bad! An Ancona will lay eggs in a cage—under conditions that would cause the ordinary breed to give up in disgust.

For egg production during an entire year, a back-yard Sheppard's "Famous" Ancona holds the world's record of 333 eggs. An Ancona flock heads the list of leaders with a record of 265 eggs. They are favorites with poultry enthusiasts who measure their back-yard space in terms of square inches.

Send for my new free booklet and learn how to bring in a permanent harvest of eggs with Sheppard's "Famous" Anconas.

H. Cecil Sheppard

Box A-425, Berea, Ohio.

President International Ancona Club.

empty you have another to start on. Do not have too many pans going, or before you can get all the sprouts fed, the oats sprouts will die from lack of any further food in the oat itself, and start to sour and smell. Feed sweet oats only. This is a long explanation, but you will find it simple and but very little time will be needed. You will very soon catch on.

It is about 4:30 in the afternoon when I arrive home from the office—too late in the winter time to feed the whole grain in the litter before roosting time, as I otherwise would. So I gather up all the day's table scraps and grind them up in a meat chopper; to this I add enough soaked oats to make up sufficient feed that they can eat before roosting. Over this mixture I sprinkle about three tablespoonsful of powdered buttermilk, stirring all up well. This furnishes the full, substantial meal to roost on. This, after putting in the scratch food for the morning, as above described, completes the work for the day.

Do not feed moldy food. Clean out your trough after feeding. Have plenty of water before them at all times. See that the dry mash hopper is always full. All this means success.

The Chickens Themselves.

Here is where the man comes in who on a back lot wants to raise chickens that will furnish both eggs in plenty and also lots of meat. So far as my experience goes, such chickens do not exist. Remember, when I say this I am talking to the city back-lotter with very limited space, and I am not talking to the man who has the space where the chickens can roam at will, with all the exercise they need. On a farm or on a big lot I know that all breeds of chickens can be raised and with success. But so far as my own experience goes—and I have raised Plymouth Rocks, Wyandottes, Orpingtons and various others of the heavy breeds—none can make such a success as the Mediterraneans, the Leghorns best of all. It is here where so many start in the business and then give up in disgust.

An overly fat chicken will never lay eggs worth her keep. The feed which goes into a lazy chicken or a chicken which does not have the required exercise, goes into fat. A meat chicken is naturally a slow motioned, easy going, and generally lazy chicken. Hence the fat and the few eggs, when cooped up in a city back-lot. The Leghorn is a fast motioned, never still, always moving chicken, never lazy, rarely clucky—hence no fat; and she will yield eggs, even if cooped up in a small place.

A friend of mine in the office has kept chickens for many years. But he has never kept a strict accounting of their record as I do. He never could see the advisability of keeping Leghorns—always wanted birds of which he "could have" a good sized one for the pot when he wanted one." I persuaded him to keep an account for a year. He is keeping Leghorns now. He found out several things, namely:

That in the fall, when his chickens were but young pullets and were but first laying, that he got as many eggs as I did.

That after the hens laid for a few weeks his eggs fell off to almost nothing, while mine were laying in full, no matter how cold. That was the time

And so is the cook

No wonder Mrs. Housewife is delighted with such an abundance of eggs. And still less wonder when you look at the kind of eggs. That's because they're the product of a flock of Sheppard's "Famous" Anconas. It does make a difference to the knowing cook.

Ancona eggs are large and uniform in size, clean and pure white in color—and as fresh as a cool breeze in a hot harvest field. No egg compound yet devised can take the place of old-fashioned "hen-fruit."

"Famous" Anconas have the habit of capturing worthwhile prizes at the world's grandest poultry shows. Their beautiful coat of black and white glossy feathers, their alert, snappy appearance—no wonder Sheppard's "Famous" Anconas are favorites not only with experienced poultry judges, but also with back-yard enthusiasts. Profit-producing pets—that's Anconas!

If you want eggs that you know are fresh—and if you want them the year around, even in zero weather—if you want poultry that "pays its way" in profits—send for complete information and my new Sheppard's "Famous" Ancona catalog. It will show you the way.

H. Cecil Sheppard

Box A-425, Berea, Ohio.

President International Ancona Club.

his chickens had gotten over their first pullethood and were getting fat from lack of exercise.

In the spring, after they had laid a good batch of eggs for a few weeks, 80 percent of them were clucky and remained that way, on and off, during the entire summer. That is, while my hens were turning out hatching eggs to sell at good prices, his hens were busily clucking and he was busy paying the feed bills.

He found, after his year was up and he had added up the actual cost of his chicken "meat," that the meat had cost him just about four times what it would have cost him to buy it from a farmer where three-fourths of the feed is found by the chickens themselves and costs the farmer nothing.

That is what disgusts so many beginners—that and the failure to start with a good laying strain. They endeavor to have a heavy working horse do the work for which a race horse is the only suitable kind, and then wonder why they do not succeed.

Another cause of failure, even with Leghorns, is the strain. That is, they do not come from stock that has been bred for generations as egg layers. If you have the kind of a poultry house I have described above, or one with that same sunlight and worth, almost any hen will lay some eggs, even in the coldest weather. But what you want is something better than that, something that you can take a pride in and know that you are making a success. You do not want only enough eggs to barely cover the cost of the feed; you want eggs enough to also cover the value of the time you spend on them, and have a profit besides. To do this, you must have a good strain, and you cannot buy this kind of a strain at the same price as barnyard fowls; and a good strain doesn't cost a fortune, either.

Counting in the eggs my family uses at the market price; what I sell the neighbors in the winter; and the money I receive from hatching eggs and young peeps in the season, I average over \$6.20 profit per bird over all expenses.

You now have the main points of how to successfully and profitably raise chickens on a city back-lot. I have the records for years right here. And you can also raise your own young stock right on the same back-lot and not lose any work doing it, either—of which I shall tell next month.

Feed for Quick Growth

This is the time of year for every poultry raiser to look ahead—to plan for big profits next fall and winter. A little time taken now to learn and apply tested methods means hundreds of dollars later. Learn how to feed for quick growth and how to save feed. Even at present low grain prices, feed should not be wasted. Learn how to develop your chicks quick for early market or early laying—how to feed at the correct periods of the day, in the right manner and in proper proportions. Don't lose money experimenting. Take advantage of what others have proved by years of costly effort. Every poultry raiser should read "Dollars and Sense in the Poultry Business" written by Prof. T. E. Quisenberry, one of America's foremost poultry authorities. This new 96-page book will be sent free to any reader of this paper. Just send a post card request to Prof. T. E. Quisenberry, Dept. 2061, Kansas City, Mo.

What Percentage of the Chicks Hatched Do You Raise?

Is your brooding system run on the hit-or-miss plan or are you sure that every chick you put under your brooders is being given the best care possible? Therein lies the secret of success in poultry keeping.

Don't experiment. It is too expensive. It is cheaper to learn from the experience of men who have made their names known all over the country through their wonderful success in the poultry industry.

Send today for illustrated catalog that tells you why the

International Sanitary Hover

is used and recommended by them and how it helped them to make good. It will be mailed you free. A postal card will do.

And the many features found only in the Sanitary Hover are fully shown in the catalog. You ought to know why it is warmest at the curtain; why the curtain is used; why only a canvas curtain and many other necessary things for the poultryman to know.

Your poultry supply dealer will be glad to show you the Sanitary Hover—The One Perfect Brooding Device.

Hatching Chicks With Hens. (Continued from page 454)

be built to provide a separate compartment for each hen.

Wherever the nest is to be located, make it right before transferring the hen to it. For the average sized hen, say a Plymouth Rock, a nest approximately fourteen inches square will be about right. The nest box should be at least six or eight inches deep in order to prevent the nest material or eggs being easily removed from it during the hatch as the hen leaves it. The bottom and sides of the nest should be perfectly tight to prevent rats or mice from entering from beneath. The bottom of the nest should be earth.

It is well to dig a sod with considerable dirt left adhering to the roots and turn this bottom side up in the nest box. Hollow out the center and fill in the corners well, packing them securely so that there will never be a danger of the eggs rolling into the corners. The earth holds a certain amount of moisture which comes up into contact with the eggs as the heat from the hen's body reaches it. It is also solid and gives permanent shape and form to the nest. The hollow in the center should be broad and shallow, so that the hen will rest comfortably and with even pressure on all the eggs.

The lowest part of the nest should be in the center, thus keeping the eggs carefully together under the hen. Over this earth there should be some good hay or straw (oat straw preferred), cut into six inch lengths. Shavings are good, if used sparingly so that there is little danger of the eggs becoming buried in them. Keep the nest perfectly clean at all times, during the hatch. The hen, if properly managed, will keep her nest practically free from filth.

Setting the Hen.

Usually it is found to be necessary to remove the setting hen from the laying house to a specially prepared nest that is located where she will be least disturbed and where she can be handled with little trouble. This transfer can best be made at night. Handle the hen very gently and quietly, carrying her with her keel resting on the fore-arm, thus disturbing her very little. Ascertain if she is lousy, and if so, apply lice powder or sodium fluoride by the dry pinch method very carefully, and this will insure her being free from these pests during the hatch. Place her carefully on the new nest, in which either some china eggs or infertile eggs have been put as test eggs. Then place the gate or cover to the nest in position and leave her until morning.

In the great majority of cases morning will find her so satisfied with her new quarters that it is then safe to remove the fake eggs and give her the real eggs. Thirteen average size eggs will make about the proper clutch for the average hen. This will depend somewhat upon season, size of hen, etc. Be sure that no more are given the hen than she can cover well and thus keep warm. Be sure all are well selected, well formed, clean and whole shelled eggs. Give the hen a fair chance to begin with.

American Poultry Supply Co., 497 Main St., Canton, Mo

There are certain definite chores connected with caring for the setting hen during three weeks on the nest, and for sake of clearness and brevity let us enumerate these and remember them as a sort of set of rules:

The nest should be so constructed that it can be closed at all times except during the time that the hen is off the nest. This for the purpose of completely protecting the setting hen from rodent enemies, other hens or any sort of pests. The setting hen should be an isolated and quiet hen.

After two days of strict confinement to the nest she can be allowed her first exercise and feeding period. Do not let her stay off the nest too long during the first ten days. Usually the hen will return to her nest within ten or fifteen minutes, and need not be forced.

Have a pan of equal parts of cracked corn and wheat nearby, and also a pan of fresh water. This is all the feed she needs during the three weeks on the nest.

See that she exercises each morning.

Look over the nest occasionally, removing any filth, broken eggs, etc.

Candle the eggs on about the tenth day, removing infertile eggs and dead germs. Sometimes the remaining eggs of two hens may be combined after the candling.

The morning is the best time to liberate the broodies, for they will usually carry back moisture on their feathers from the early dew to suffice in moistening their eggs. Otherwise sprinkle them with warm water just before the hen is ready to return, from the tenth to the eighteenth days.

On the nineteenth day close up the nest and do not bother the hen until she is through hatching her eggs.

The Packers Interest in Poultry Productions.

(Continued from page 455)

At the end of the feeding period, the poultry is scientifically dressed, chilled, graded and packed into the firm's leading brands—Swift's Premium Milk-Fed Chickens, Swift's Royal Rock Milk-Fed Chickens—both representing high character product, while those birds, showing either deficiency in flesh or improper dressing are excluded from the best grades and sold separately on their merits.

Attention should be called to the fact that poultry feeding is a specialized industry. While better breeds and better handling on the farm produce a better character of poultry for feeding purposes, the finishing of the poultry by the method of milk feeding cannot be successfully accomplished on the diversified farm, because it takes special facilities and special care. After the feeding process, the poultry must be immediately dressed and prepared for shipment, because after the feeding process, the live poultry is of very delicate nature and would not only show a heavy shrinkage in shipping from the farm to the dressing plants, but would also show a material depreciation in quality.

The greatest and most important factors in connection with the hand-

HI-YIELD

Automatic Feeder, Water Fountain & Chick Protector

This device has been on the market for over eight years and we stand back of it with our binding guarantee. It will feed and water 150 chicks at one filling. By removing the protecting shed it can be used for feeding and watering large chickens. The reservoir or feed supply can hold about one-half bushel. Inside the feed can is a two gallon water reservoir. The water feeds automatically into the outer trough, which is divided into partitions; feed is in one side and water in the other. Water is kept cool by a three inch feed space around water tank. The wire pins will let in the small chicks and keep out the larger ones. Pins can be adjusted as chicks grow larger. Made entirely of galvanized steel—a tight cone shaped lid covers entire feed can. Write for full particulars about this device as well as the complete Hi-Yield Line of barn yard equipment. Address

BROODER

For \$4.96, including heater, you can build the simplest, most efficient, and most satisfactory brooder ever made. Wind-proof; fire-proof; rat-proof; fool-proof. Can be built by anyone in an hour, with saw and hammer. Plans, 10c.

\$4.96

I. PUTNAM Route 405 B ELMIRA, N. Y.

ling of poultry, eggs and cream are:

1. Improved breeds of poultry and dairy stock.
2. Proper care of the products by the producer.
3. Quick and intelligent marketing that the products may reach the manufacturing or preparing plants in prime condition.
4. Prime raw material is absolutely necessary to produce prime finished product.

The method of handling eggs is quite as interesting as the method of handling poultry. The greatest care and efficiency is exercised throughout the buying to get the high character stock, quickly marketed by the producer, well handled by country buyers and the quickest and most direct transportation to Swift & Company's produce plants.

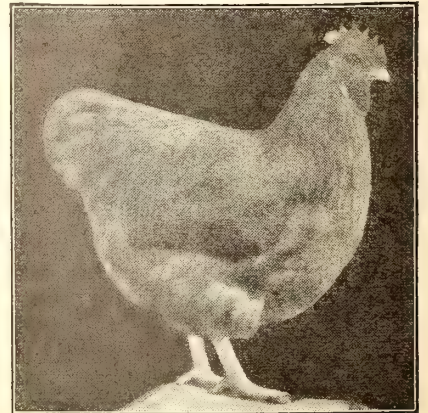

Here the eggs are carefully graded, repacked into standard packages, immediately placed under refrigeration, and so remain up to the shipping time. They are forwarded in refrigerator cars, are protected by refrigeration on arrival at our distributing houses in the selling districts, and as fast as needed by the retail trade, are recandled into standard grades of Swift's Brookfield Eggs in cartons and Banner Brand Eggs, while any eggs not meeting the high standard of specifications of these two brands are packed separately and sold on their quality merits.

While a moderate amount of poultry and eggs is produced on the highly specialized poultry farm, confining its efforts only to the production of poultry and eggs, it is a fact the bulk of the production of these products is on the diversified farm, and here lies the greatest future of the industry.

The possibilities for improving the breeds are very great. There is a vast difference in the quality and character, and especially the size of these products in the different districts of the country.

Poultry and eggs of large size are the most desirable; they bring the highest net return to the producer. Product of large size can be produced almost as cheaply as the small or mongrel character of poultry, and, of course, is more desirable to the wholesaler, distributor, retailer and consumer.

A comparison of the unit weight of poultry and eggs produced in the different sections shows a remarkable difference.

S. C. Buff Orpington cockerel, heading one of the pens on Wyant Bros.' Farm, Thornton, Ind.

S. C. White Leghorns

A good laying flock on free range, which insures high fertility.

Baby Chicks and Eggs for Hatching

A Phenomenal SUCCESS

Why

Sol-Hot Wickless Oil Heaters Have Proved So Successful and Superior

"Nothing happens by chance." There is always a definite reason for everything. The phenomenal success and popularity that Sol Hot Heaters have achieved among poultry raisers, is due to their extraordinary M-E-R-I-T. They have filled to such a gratifying degree, a long felt want that no other heaters on the market have even approached. They embody the fundamental principles that are absolutely necessary in a heater for the successful hatching and rearing of chicks.

I am the originator and inventor of the Canopy Brooder and Sol Hot Heater. When first offered to the public years ago, I knew that their basic principles were correct. Since then the new improvements which years of study have enabled me to work out and apply, make Sol Hot Equipment without a question, as nearly perfect as modern skill and inventive genius can produce.

My expectations have been more than realized. Sol Hot Heaters soon gained first place in the estimation of the public, and each succeeding season found them more and more in popular favor until today, with my latest modern improvements, they are so far superior that there is no comparison.

Sol Hot Equipment has won its place in the estimation of poultry raisers, simply because it has overcome the discouraging, costly imperfections that poultry raisers have experienced with ordinary heaters.

They have done all and more than that claimed for them—*have more than made good*. They are in a class by themselves. Don't confuse Sol Hot Heaters with the "imitations" and the many cheap make-shift cook stove burners made by stove manufacturers, but assembled and sold by some incubator concerns for brooder use.

Don't be misled. Buy only the original Sol Hot—the best and therefore the cheapest in the end. They are thoroughly covered by patents, so don't take chances by buying an infringement.

In a recent letter from E. C. Matlick of the well known Miller-Mat-

lick Hatching Co., he says: "Your improvements on Sol Hot burners make them superior to anything on the market."

That's what users of Sol Hot say. That's what you will say, too, after you have given Sol Hot a trial and compared it with other heaters. If you are not using Sol Hot Heaters now for your incubators and brooders, don't fail to write for our free illustrated catalog, telling all about these better and cheaper burners. Sol Hot will do for you what it is doing for thousands of others.

SOL-HOT BURNERS

"**N**OTHING Succeeds Like Success" is an old truism to which Sol Hot Equipment has added even MORE TRUTH or emphasis. The volume of evidence which is daily pouring into our office, by way of ORDERS and RE-ORDERS—and letters by the hundreds from grateful purchasers, telling how much better they find Sol Hot Heaters, is the REAL PROOF that PROVES "Sol Hot Wins Over All."

Here is the crowning point of our success in perfecting a heating device for artificial hatching and rearing of chicks—the SOL HOT BURNERS. The base of the burner is made of gray cast iron and will last a lifetime. The outer casing, or chimney, is of heavy sheet steel. Inside of this are the perforated screens which are made of the best material possible for the purpose. They are much heavier than screens used in other oil burners because of the intense heat produced by the Sol Hot principle.

Note that the Oil Feed Pipe enters the side of the Burner instead of the bottom. This has two distinct advantages. First, any accumulation of carbon or other matter cannot clog the oil groove, thus overcoming the necessity of frequent cleaning of the oil feed pipe. Second, it provides a preheating chamber in which the oil is partly vaporized before it reaches the flame. This materially assists in obtaining more perfect combustion.

East Helena, Mont.

H. M. Sheer Co.,

Gentlemen:—

Your Sol Hot Heater is the greatest method of heat I ever used. Send me by express another colony brooder outfit same as I bought last season. Enclosed find draft for same.

CHAS. BLACK.

Mannville, Ill.

H. M. Sheer Co.,

Dear Sirs:—

I am enclosing check to pay for one more Sol Hot lamp. They are the best heating system for an incubator I have ever used.

HARRY R. DICKENS, P. R. No. 1.

H. M. Sheer Co.,

Hanover, Pa.

Gentlemen:—

I have one of your Sol Hot Burners which I used on our incubator with perfect success. Will you send me diagram or picture how to connect it with a colony hover? It certainly worked fine on our incubator. J. C. MILLER.

Two Important Improvements

Of my new 1920 improvements, the two outstanding features are the Automatic Oil Control and my All Metal, Non-Carbonizing Vaporizers. These improvements make Sol Hot Heaters as near perfection as human skill and inventive genius can produce.

AUTOMATIC OIL CONTROL

This new improvement automatically controls the flame. Once you set the adjustment screws your flame will increase or decrease

automatically according to temperature variations.

This improvement completely solves the problem of keeping incubator or brooder at same temperature with changing of weather conditions without the bother of frequent attention. You know the difficulty of maintaining a steady flame with a wick lamp. It means very frequent attention with varying success. Wick flames are bound to CREEP up as the burner gets hotter. In fact, this danger is so great it is folly to use wick burners when you can insure ABSOLUTE safety from a Sol Hot Lamp and get better results. The flame cannot CREEP up or down in a Sol Hot Lamp. This advantage alone is worth the price of a Sol Hot Water Heater.

All-Metal Non-Carbonizing Metal Vaporizer

This new all Metal Vaporizer completely

does away with carbon—no asbestos ring to carbonize and deaden the flame. It is one of the most important inventions in perfecting wickless oil heaters. Poultry raisers who have experienced the trouble caused by asbestos rings carbonizing know only too well what this new invention means in doing away with these troubles. Starts instantly with gasoline or denatured alcohol or starts easily with kerosene by simply slipping a band of common newspaper around the vaporizer letting it extend down into the oil—the paper burns away and generates the burner. This Metal Vaporizer fits all sizes and makes of wickless oil burners, but is made principally for and to further perfect Sol Hot burners. It practically converts a Sol Hot Oil Burner into a gas burner. The flame responds instantly to any change of oil feed. I recommend to all owners of old Sol Hot Burners, that they send for one of these All Metal Vaporizers. Price postpaid \$1.00. All New Sol Hot Burners are equipped with this Metal Vaporizer. This All Metal Vaporizer is completely covered by patents—anyone making a metal vaporizer that permits oil vapor to pass through the vaporizer from either side to the other, is infringing on our patent rights and will be prosecuted. Our patents cover practically every construction except a plain or corrugated band which of course is of no value whatever.

Is Over All

GIANT SOL-

HOT HEATERS

for Coal Burning
Brooder
Stoves

Sol Hot Heaters win the preference of poultry raisers because they meet every need, and fit in with present equipments so nicely. See how my Giant Sol Hot Heater is adapted to coal burning stove, thus doing away with ASHES—GASES—COAL, unreliable uniformity of heat, etc. It is easy to install and when once set and regulated, needs no further

attention other than keeping a supply of oil in glass reservoir. No ashes to remove—no draft damper to regulate—no need to raise or remove the brooder hood. The satisfaction and successful operation of Giant Sol Hot Heaters for large broods of chicks is proving a big boon to hundreds who had become discouraged and disgusted with coal burning brooder stoves.

Sol Hot Heaters are made in five different sizes for Canopy Brooders and five sizes for Incubators from 60-egg size up to 3,000-egg machines.

H. M. Sheer Co., Kenosha, Wis.
Dear Sirs:—

I have used one of your Sol Hot Colony Brooders for two years, and find it O. K. Would like your price on the Giant Sol Hot for coal burning heater.

C. NEERGAARD, R. F. D. No. 2.

H. M. Sheer Co., Media, Pa.
Dear Sirs:—

I have used three of your Sol Hot Heaters on Incubators for three years. They are fine. Will never change to any other.

WM. HOLM.

H. M. Sheer Co., Lichfield, Ohio.
Gentlemen:—

I have 500 chicks under one of your Sol Hot Brooders and it is like "home, sweet home" to them. Would like your plans for building Mammoth incubators with your Sol Hot Lamp.

J. R. RANDYSIDE & CO.

Sol-Hot Heaters for Incubators

The illustration below shows the new Sol Hot combination for incubators. Note how the burner can be lowered and swung to one side without disturbing the position of the oil fount, or changing the oil adjustment regulator. This improvement

does away entirely with the necessity of adjusting the regulator every time the lamp is handled—a convenience that every user of an incubator lamp will appreciate.

The man who makes the best success these days in any line of business, is the man who is best equipped to produce the thing he sells, whether it be automobiles, eggs, baby chicks or poultry. The best equipment is the cheapest in the end and you will make no mistake when you buy Sol Hot. The

time you save—the better hatches you get—the bigger and faster growing chicks you will raise will make you a Sol Hot "booster" ever after. Send for my catalog folder and get full particulars. It will interest you—it's FREE. Send for it today.

A Word to Dealers and Agents

The unusual demand for Sol Hot Equipment is a pleasant surprise to dealers who handle my goods. It is a long time since they have handled any poultry equipment which gives their customers such gratifying results and satisfaction. These customers tell their friends of the splendid performance of Sol Hot Heaters and thus the demand grows and grows. I want more dealers and agents and will be glad to hear from anyone interested in selling my goods. Write for terms and full particulars. Address me personally.

H. M. SHEER, Prop.

I recommend to all owners of old Sol Hot Burners, that they send for one of these All Metal Vaporizers. Price postpaid \$1.00. All New Sol Hot Burners are equipped with this Metal Vaporizer. This All Metal Vaporizer is completely covered by patents—anyone making a metal vaporizer that permits oil vapor to pass through the vaporizer from either side to the other, is infringing on our patent rights and will be prosecuted. Our patents cover practically every construction except a plain or corrugated band which of course is of no value whatever.

GIANT SOL-HOT HEATERS

for Coal Burning
Brooder
Stoves

Sol Hot Heaters win the preference of poultry raisers because they meet every need, and fit in with present equipments so nicely. See how my Giant Sol Hot Heater is adapted to coal burning stove, thus doing away with ASHES—GASES—COAL, unreliable uniformity of heat, etc. It is easy to install and when once set and regulated, needs no further attention other than keeping a supply of oil in glass reservoir. No ashes to remove—no draft damper to regulate—no need to raise or remove the brooder hood. The satisfaction and successful operation of Giant Sol Hot Heaters for large broods of chicks is proving a big boon to hundreds who had become discouraged and disgusted with coal burning brooder stoves.

Sol Hot Heaters are made in five different sizes for Canopy Brooders and five sizes for Incubators from 60-egg size up to 3,000-egg machines.

H. M. Sheer Co., Kenosha, Wis.
Dear Sirs:—
I have used one of your Sol Hot Colony Brooders for two years, and find it O. K. Would like your price on the Giant Sol Hot for coal burning heater.
C. NEERGAARD, R. F. D. No. 2.

H. M. Sheer Co., Media, Pa.
Dear Sirs:—
I have used three of your Sol Hot Heaters on Incubators for three years. They are fine. Will never change to any other.
WM. HOLM.

H. M. Sheer Co., Litchfield, Ohio.
Gentlemen:—
I have 500 chicks under one of your Sol Hot Brooders and it is like "home, sweet home" to them. Would like your plans for building Mammoth incubators with your Sol Lamp.
J. R. RANDYSIDE & CO.

Sol-Hot Heaters for Incubators

The illustration below shows the new Sol Hot combination for incubators. Note how the burner can be lowered and swung to one side without disturbing the position of the oil fount, or changing the oil adjustment regulator. This improvement does away entirely with the necessity of adjusting the regulator every time the lamp is handled—a convenience that every user of an incubator lamp will appreciate.

The man who makes the best success these days in any line of business, is the man who is best equipped to produce the thing he sells, whether it be automobiles, eggs, baby chicks or poultry. The best equipment is the cheapest in the end and you will make no mistake when you buy Sol Hot. The

time you save—the better hatches you get—the bigger and faster growing chicks you will raise will make you a Sol Hot "booster" ever after. Send for my catalog folder and get full particulars. It will interest you—it's FREE. Send for it today.

A Word to Dealers and Agents

The unusual demand for Sol Hot Equipment is a pleasant surprise to dealers who handle my goods. It is a long time since they have handled any poultry equipment which gives their customers such gratifying results and satisfaction. These customers tell their friends of the splendid performance of Sol Hot Heaters and thus the demand grows and grows. I want more dealers and agents and will be glad to hear from anyone interested in selling my goods. Write for terms and full particulars. Address me personally.

Order Direct from This Ad

Save Your High Priced Chicks This Year

Now that the hatching season is here I am making this special offer to readers of this magazine. If your dealer can't supply you with a Sol Hot Canopy Brooder you can order direct from this advertisement without waiting to send for catalog, etc.

Just fill out and mail coupon below together with check or P. O. Money Order for the size Brooder wanted and I'll send it to you at once with the understanding that if you are not more than pleased with it—if you don't find it one of the most easily operated brooders you ever saw—you can send it back at my expense and I'll refund your money.

Order Your Sol Hot NOW—Don't wait—be prepared to save every chick this year. Eggs are high and baby chicks are high. You can't afford to try and raise your chicks in a brooder that is not kept at a uniform heat during sudden changes of temperature. Sol Hot will keep your chicks cozy ALL THE TIME. They will "grow like weeds," and you'll always be glad you ordered the Sol Hot.

Baby Sol Hot Brooder

THE BROWN LEGHORN.

By H. V. TORMOHLEN.

As a small boy it was my lot to help my grandmother tend the chickens on the farm. Thus at an early age I became acquainted with the wonderful laying qualities of the Brown Leghorns. They laid such fine, big, white eggs and were so hearty and active that I admired them very much. They were always busy, their combs nice and red and their brown coats neat and clean, so it was no wonder that a boy should admire such a business-like fowl. Right there and then I made up my mind that some day I would have a lot of Brown Leghorns of my own. But how that dream developed into the biggest Brown Leghorn farm in the country is another story and at this time I want to tell you about how to care for Brown Leghorns to get the best results and how to mate them up to preserve their egg-laying and beauty from one generation to another.

Leghorn is a port in Italy and the story has it that Brown Leghorns originally came from that port—hence the name. But as a matter of fact, the Leghorn we have here in America is an American made fowl representing the vim and vigor, activity and business like qualities of the present day American.

Before the advent of Leghorns our barnyard fowls were the slow-moving feather-legged variety, not exactly suited to our needs. It was not strange then that the Leghorn immediately became very popular and spread from farm to farm all over the continent, until today it is estimated that 60 percent of the total fowls kept are Leghorns.

The Brown Leghorn of the past was built a little different than our present day Leghorn in that its tail was carried almost erect, in fact many had tails carried so far toward their head that they were referred to as "squirrel tailed." Then most of them had very large beefy-like combs. In keeping with American ideas of efficiency and beauty, the tails were bred lower and the combs smaller, for it was found that, contrary to common belief, the comb is not directly related to laying qualities and a smaller comb is much better in that it does not obstruct the sight of one eye nor freeze so easily in winter.

Today we have a Leghorn hen built on two very trim, active legs, capable of taking her far afield in search of food. Her body is long, deep and broad, making possible the consumption of plenty of feed to manufacture lots of eggs. Most of us know that dairymen breed their cattle to get exactly the right shape of body to get the greatest milk making capacity. That is exactly what we tried to do with our Leghorns. While the Leghorn was naturally a great layer, we were not content with accidental good qualities so we started out to learn how to grow hens so that practically every one of them could have a wonderful egg-laying type and constitution. To make this possible the Leghorn must not only be long bodied, but the body must be deep and wide.

The length of the body is easily judged by the eye, but we can better

ANDREWS CARRIERS

For Baby Chicks

Three sizes, for 25, 50 and 100 chicks. Built to conform to International Baby Chick Association specifications. Car lot orders made to meet buyer's specifications. Strongly built of heavy corrugated board—waterproof inside and out—shipped flat—set up in a jiffy. And they carry the chicks in comfort and safety.

Andrews Carriers are made in one of the world's greatest box factories. We can promptly make shipments of any quantity—from two dozen of a size up to a carload. And our prices are surprisingly low. Andrews Carriers are right. "Ask the Judges." Write now for complete catalog.

For Eggs

Ten sizes—ranging from 12 to 120 egg capacity. These carriers absolutely prevent breakage. Further, they protect the egg-contents by preventing shocks. Each egg protected by several thicknesses of corrugated cushions. Simple and practical. Can be used many times, but cheap enough to throw away after a single trip.

O. B. Andrews Co., Dept. A, Chattanooga, Tenn.

MILLER

READY-BUILT HEN HOUSES

Save Money on Houses

HEN HOUSES all built, ready to bolt. No extras, no delay, no bother. Everything included — hardware, roosts, nests, tables, roofing. Clear yellow pine, tongued and grooved, even to the roof. Creosoted and trimmings painted. Built in complete units. Add units as flocks grow. If you move, take your house along. More substantial than many permanent buildings.

Missouri Fool Proof House

Light and ventilation can't be neglected. Just one of many designs shown in the Miller Book.

judge the depth and width of a hen by testing with the fingers of one hand. This will show whether she has 2, 3 or 4-fingered capacity between the keel and pin bones. Then the same test can be made between these two pin bones found directly on either side of the vent. If these bones are well spread apart and soft and pliable the hen has capacity for egg-laying, and if fed properly and cared for properly she can lay with little effort. So we see why it is extremely important that we select hens that are built to lay as well as bred to lay.

During recent years with feed so high priced, the Leghorns has been very much more popular than ever before because of the fact that she requires about a fourth less feed to produce the same number of eggs than the larger varieties. This one quality makes the Leghorn superior as a money making proposition as statistics show that 60 percent of the total fowls kept are Leghorns.

Light Brown and Dark Brown Leghorns.

There are two kinds of Brown Leghorns, Light Brown and Dark Brown, although they have been bred this way only during the past 20 years. The two varieties were produced from the same family tree and there is no difference in their qualities. It was merely a matter of choice of color that led Leghorn enthusiasts to develop the two extremes. The two families or varieties should not be crossed any more than you would consider crossing Brown with White Leghorns, if you would seek to keep a uniformly colored flock.

The Light Brown Leghorn male has a straw or lemon colored neck with a slight trace of a stripe down each feather, sometimes entirely absent. This stripe is about the same shade of color, only slightly darker, for the saddle feather coloring. This will enable you to tell a Light Brown Leghorn male at sight. The Dark Brown Leghorn male has a rich cheery-red neck and saddle which should be of a rich even shade with a nice black or greenish stripe down each feather.

The Light Brown Leghorn female has a golden colored neck with a black stripe down each feather, often not very distinct. Her back and wing feathers are a nice brown, finely stippled, or dotted with a darker shade of brown, the whole effect giving a fine velvety appearance. She has a salmon colored breast while her body and thighs are a slate color.

The Dark Brown Leghorn.

The Dark Brown Leghorn hen is more of a mahogany brown color, the stippling or penciling being coarser in appearance. The breast is colored almost like the back although it has a slightly lighter shade. The neck of the Dark Brown hen should be red like the Dark male and should have a nice stripe down each feather. The Dark Brown Leghorn hen is more like a Partridge Cochins or Partridge Plymouth Rock in color which will make it easy to tell the difference between the Light and Dark hens. Occasionally a Dark hen has a breast that shows quite a little salmon color, which is not so objectionable if her other markings are correct, but prac-

HOW TO RAISE BABY CHICKS

Put Avicol in the drinking water

Most people lose half of every hatch, and seem to expect it. Chick cholera or white diarrhoea is the trouble. The U. S. Government states that over half the chicks hatched die from this cause. An Avicol tablet in the drinking water will save your chicks from all such diseases. Within 48 hours the sick ones will be lively as crickets.

Mrs. Wm. May, Rego, Ind., writes: "I was losing 10 or 15 chicks a day from diarrhoea before I received the Avicol. I haven't lost a one since."

It costs nothing to try Avicol. If you don't find that it prevents and controls white diarrhoea, chick cholera and all bowel diseases of poultry, tell us and your money will be promptly refunded. Avicol is sold by most druggists and poultry remedy dealers, or send 52c (includes war tax) for a package by mail postpaid. Burrell-Dugger Co., 200 Columbia Bldg., Indianapolis, Ind.

1897-Hawkins Light Brahmas-1921

Eggs for Hatching

Grand lot of breeders after May 1st.
J. S. HAWKINS, 118 S. 6th St., WACO, TEXAS

tically all Dark Brown hens have the salmon breast feathers dotted or stippled with a darker shade of brown which makes the breast and back look almost the same.

The Dark Brown Leghorn male is mated to the Dark Brown Leghorn female, of course, although occasionally we get inquiries from someone asking if it would not be better to mate the Dark male and the Light female together. The answer is that the offspring would be nothing more than mongrel Leghorns at best.

The Light male is mated to the Light female and care should be taken in building up a flock of either Light Brown or Dark Brown to see that the stock comes from reliable breeders who are known to breed them pure—true Dark Brown or Light Brown and not just simple "Brown Leghorns." The average farm flock of Brown Leghorns today is of the old Light Brown blood, for practically all have the light or salmon breasts. With a few good Light Brown cockerels from a breeder who has made a specialty of breeding for color and egg-laying qualities, the ordinary flock can quickly be bred up and improved until within two or three years you can hardly realize that the fine looking cockerels and pullets came from such a foundation.

Many prefer the Dark Browns and there are a few more breeders keeping them than Light Browns. Although the Light Browns predominate among the average farm flocks we do not know how long this will be the case.

Brown Leghorns should be given plenty of room to range. For this reason they do their best on the farm although we made our start on a village lot and raised them in confinement for a number of years with good results. They should have nice, clean houses, with plenty of fresh air and sunlight and a deep litter of straw to which the scratch grains can be scattered each day. Nothing lends more to good health and vigor than a training to scratch for the grain. During the season of the year when the Leghorns can not roam over the fields to get plenty of bugs and worms, a good mash feed should be fed once a day, 15 percent of which should be a grade of tankage or dry poultry meat scraps made especially for poultry mash.

Small and cracked grains—a mixture is all the better—should be fed in the litter early in the morning to induce exercise and keep the hens healthy. The mash can be fed about noon and another feed of grain given at night during the winter months. But to get the most eggs, care must be taken to see that about 10 percent of the total feed given to the fowls is meat food.

Give the Brown Leghorns a chance and they will make the finest of all winter layers, in fact all-year layers, for the pullets lay best in winter while the hens will lay better during late winter and spring. Contrary to popular belief, the Brown Leghorn is a fine bodied fowl and reaches frying age quicker than most any other variety and the adult hens make the finest roasts one can imagine.

TREATMENT OF ROUP.

Much of the material we read about poultry diseases is either beyond the understanding of the ordinary poultryman or they are so much alike that, after reading three or four bearing upon the same subject, we know no more than if we had read but one concerning the topic. What I am about to relate in regard to that most contagious disease, roup, is not what I have read but from my own experience in the last three years when I have come in contact with the disease. It is a true word-for-word statement of what I have learned and what conclusions I have drawn as to the causes, nature and cure of roup.

Roup in this section of New York state had practically been unheard of until about two years ago an epidemic seemed to have broken out which resulted in great losses to both large and small poultrymen. I was so unfortunate as to have been one of the victims. Of course I had read considerable about the subject from agricultural station bulletins, but at the first appearance of the disease I discovered that the literature was of little use. I do not desire to condemn this material except to point out that "experience makes perfect and is the best teacher" and that all the book learning in the world cannot make everything successful.

The first time that roup appeared we did not think it serious and so let it go. Out of a hundred birds two or three were affected. I was at first uncertain as to the nature of the disease but after further investigation I decided it was roup. As the disease did not spread any further I did not bother my head about it until the next year, when after raising 300 fine pullets out of 600 chicks the disease gained a foothold in the flock. Precautions had to be taken—but what?

There does not seem to be any remedy with the exception of patent medicines. The only thing to be done seemed to be to first check its further spread. The coops were then cleaned, disinfected and whitewashed and infected chickens culled from the flock. I then inquired of others what they had experienced in this line, and in accordance with their recommendations I supplied myself with permanganate of potash and a household disinfectant. The permanganate I gave to both well and diseased birds—putting enough in the water to give it a wine color. The disinfectant I mixed according to stated directions and dipped the infected birds' heads in the solution twice daily. It is generally thought that roup is incurable but in this instance it proved otherwise for at the end of a short time the sick birds became well.

In the remaining flock, however, we still came across a few ill birds now and then. This led me to conclude that permanganate of potash was not a sure preventive or cure, but that the disinfectant or dip was a promising cure. When dry weather settled in, the disease entirely disappeared and we thought that after losing a great part of our flock we were at last rid of the pestilence. The next year, however, we were again troubled. What could be the cause was beyond me, for I attributed the first epidemic to the fact that my birds perched on trees during the damp and rainy weather; but now the birds had not begun to roost.

The birds first mentioned in this ar-

Stop Hatching Weak Chicks

With Cheap Incubators

Remember, it is not how many you hatch that counts, but how many you raise. A Queen costs but little more, and the extra chicks that live and grow soon pay the difference.

Queen Incubators

Hatch Chicks That Live and Grow

Accurately regulated—taking care of a variation of 70 degrees without danger. Built of genuine Redwood—very scarce in these days of imitation. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. Catalog free.

Queen Incubator Co. Lincoln, Nebr.

Let your Hens decide

On one hand the fine clean odor and appetizing, nourishing digestible qualities of unadulterated beef and bone butchers' trimmings; on the other, "any old thing" which does for other brands.

DISEASES OF POULTRY

By D. V. Salmon. 252 pages; 72 illustrations. Every poultryman needs this book. The cause, symptoms, care and remedies for each disease fowls are subject to are given. Price 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

ticle were raised from good stock, bought in Pennsylvania and those last mentioned we hatched ourselves from the same flock which had last year been affected with the disease. Both flocks received the same treatment and care; the last mentioned flock, however, had access to the same runs. I therefore came to the conclusion that the disease was transmitted either through the egg or by the droppings and earth.

A considerable part of the flock was lost until I managed to check the spread of the malady. I made use of the potash and in addition I put about three teaspoonfuls of kerosene to a pail of water. The infected birds I gave the same and painted the eyes and throat with iodine. Very often a white film closes up the throat passages of the bird resulting soon in death. Painting with iodine seems to remove this substance. We cured the majority of these birds but we usually killed them for market as we believe they will not be good for breeding or egg production.

In a few words I sum up the causes and treatment of roup: Causes: drafts; remaining in the cold, damp air nights; transmitted through the egg and earth over which infected birds had access and through infected bird droppings. Treatments: Permanganate of potash in water enough only to color it to a wine color. Add to this two or three teaspoonfuls of kerosene. In warm weather dip the birds' heads in a dip prepared with some household disinfectant. Paint swollen eyes with iodine and also paint the throat.

New York. Arthur Ewigkeit.

Getting Black Color in Javas.

To get sheen on black birds feed cooked meat and suet daily, watch droppings closely as a too heavy feeding of meat is liable to cause looseness of bowels.

Hemp seed, flaxseed and sunflower seed all have a very decided influence in putting on surface gloss of feathers while tincture of iron (about ten drops to a quart of drinking water) intensifies black in plumage, especially in undercolor.

Feed hemp the same as you do sunflower seed. Flaxseed is better than linseed meal, the latter being too laxative.

If you use too much tincture of iron, the bird may grow an occasional rusty feather.

Some had birds come with red feathers, and one time started to make a red Minorca from such foundation, but never bred a Black Java showing red. Red usually occurs on the head or in the hackle.

Don't mate the highest sheen together. I mate the highest sheen males to dull black but block-black females. I think that you get the color from the male. There is a tendency to the red in the hackle when both sexes have high sheen.

Purple bars are the bane of all black varieties. By feeding a little sulphur in the mash, also a little oxide of iron, I have overcome it considerably. Grow the birds in a cool, shady place as purple may enhance by direct action of the sun a sort of sun brown. Mites, lice, poor feeding and crowding all cause purple, and also are a direct cause of white in black varieties.

Henry C. Turck.

Illinois.

Robadel Orpingtons WHITE—BLACK—BUFF

Again demonstrate their superiority at the Great Madison Square Garden Show, January 18-22, 1921

AS FOLLOWS:

Poultry Work in the Southwest

Work Along Experimental Lines for Semi-arid Regions of the United States. Practical Work Being Done to Show the Value of Better Breeding and Feeding Methods

By NAT. E. LUCE

Poultryman in Charge, U. S. Poultry Experiment Station, Glendale, Arizona.

The U. S. Poultry Experiment Station located at Glendale, Arizona, in the great Salt River Valley, was formerly the Government Ostrich Farm. At the earnest solicitation of the Arizona Ostrich Breeders' Association, the U. S. Department of Agriculture in 1913, under an initial appropriation from Congress, entered into co-operative work in the breeding and feeding of ostriches. Conditions became such that it was not deemed advisable to carry on research and experimental work with ostriches further, and this work was considerably curtailed and merged into the poultry department work. Harry M. Lamon, senior poultryman of the U. S. Department of Agriculture, recognized the feasibility of turning this farm into a poultry experiment station. This was sanctioned by the department and steps were taken to make of it a poultry experiment station where investigations and experimental work suitable to the semi-arid regions of the southwestern part of the United States could be carried on.

In November, 1919, the first shipment of chickens was sent to Glendale, Arizona, from the Government Poultry Farm at Beltsville, Maryland. This shipment consisted of S. C. White Leghorns and S. C. Rhode Island Reds.

C. H. Cross, executive clerk, who had been in charge at the Glendale station, had the poultry buildings, suitable for the needs existing in this district, constructed from plans furnished by the poultry office of the bureau. The actual poultry work at the station was started in the fall of 1919 by D. M. Green, who was sent out from the Washington office and remained until the spring of 1920.

Feeding Experiments.

On July 1, 1920, Nat. E. Luce was placed in charge of the work and the actual experimental work was begun. On November 1, 1920, there were started nine experiments in feeding and breeding. The first three months have shown some peculiar results not unlooked for by those in charge. Two feeding experiments in particular have shown some very clear results as to the value of proper methods of feeding over those of poor feeding of the average flock as fed by the farmer.

In experiment No. 3-A thirteen S. C. White Leghorn pullets are fed a regular standard ration for egg production, consisting of dry mash fed in hoppers kept before the fowls at all times. Grit, shell and sour milk are constantly before them. This pen had laid from No-

Wyckoff's S. C. White Leghorns

AMERICA'S BUSINESS HEN

Acknowledged everywhere as the World's Greatest Laying Strain—unequaled in standard qualities. Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most profitable strain of poultry in America today. Place your orders at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that on recent investigation of 20 of the largest and most successful Leghorn egg farms in the United States, in every instance, it developed that the WYCKOFF LEGHORNS were their foundation. The most substantial proof of their exceptional quality.

EGGS FOR HATCHING

from the most carefully selected matings. Our breeding pens for 1921 are made up of the most carefully selected lot of stock in the country, barring none. Every egg furnished will be from a grand lot of special selected birds, representing our highest quality stock in every particular. For size, strength, vigor and laying qualities, together with the true Leghorn type, they are unequaled. **Positively no second grade or immature birds mated, and no orders filled with eggs from “farmed-out” or other bought up junk. We are BREEDERS, not hucksters.** Place your order for some of the eggs from this high grade stock, and get in line with the most profitable era ever known in the poultry business. Send for free catalog, giving prices and complete description of stock, together with testimonials from satisfied customers in all sections of the country. Address

C. H. WYCKOFF & SON

AURORA

CAYUGA COUNTY

NEW YORK

ember 1, 1920, to January 31, 1921, 413 eggs.

In Experiment No. 4-A pen containing the same number of S. C. White Leghorn pullets out of the same parentage and fed and brought up alike until November 1, 1920, the date the experiment was started, have laid to January 31, 1921, 176 eggs, or nineteen and three-quarter dozen eggs less than No. 3-A pen, showing a loss in productive value in cash of \$11.85 as compared with pen No. 3-A.

Pen No. 4-A is fed according to the average farm way of feeding, a grain ration all they will take, without a good laying mash. They were furnished grit and shell in hoppers, had a good large alfalfa run the same as Pen 3-A, but are steadily losing ground in egg production. This experiment will be carried through for the year as a practical illustration to the farmer of the fact that it pays to feed well.

Another experiment of equal value is No. 2-A. This pen consists of ten late

View of Poultry House on Alamo Ranch, 18x50 ft.; open front and open ends and sides covered with 1-inch wire mesh. Canvas curtains are used in winter for protection against cold and drafts; this allows a maximum of ventilation with the minimum of drafts or cold.

hatched S. C. White Leghorn pullets selected for their Leghorn type, with fine headgear, and would be a credit to any showroom. They have laid a total to January 31, 1921, of forty-five dozen eggs for the three months, and at the present writing (February 8, 1921) are still keeping up their stride. The birds have produced eggs sold at a market price of a cash value of \$27. The actual expense of all feed, labor and overhead charge was \$8.75, leaving a net profit above all for the three months of \$1.82½ per bird.

The experimental work carried on at the U. S. Poultry Experiment Station is done with the one idea of showing the farmers and poultrymen the value of Standardbred stock, properly selected as to type and egg production, and being fed proper rations to promote egg production and vigor, in a plain and practical way.

On November 17, 1920, a field day was held at the station under the auspices of the Poultry Producers' Association of the Salt River Valley, and an attendance of over two hundred persons with a deep interest in the work was a fine tribute to the value of the station in its endeavors in behalf of the poultry industry of the southwest. The writer explained the experimental work to be carried on this year and telling what the station represented to the people of the southwest in general and Arizona in particular. The day was so well spent that it is now intended to make it an annual event.

Conditions in the southwest are at such a variance with conditions elsewhere in the United States that the Glendale station with the work started

Brood Your Chicks with a Hen

Nature-Plus has solved the brooding problem for 50,000 poultry raisers in the United States and foreign countries, and is fully capable of solving yours. G. F. Kiessel, N. Champa St., Boone, Iowa, says: "I would not surrender the right to make and use Nature-Plus for \$500." H. A. Gray, Route 2, Fennville, Mich., writes: "It is far more successful than any artificially heated brooder I have ever seen." The Nature-Plus Hover is a practical combination of your hen and our hover. It will enable your hen to brood 150 to 200 chicks as safely as she could brood a dozen without the hover. No artificial heat, no danger, no expense. Patented in United States and foreign countries. Easily made with simple tools. Plans and rights sold to users under money-back guarantee. For further information, address,

NATURE-PLUS COMPANY :: HILLSBORO, OREGON

"LADY BEAUTIFUL"

PULLET LINE ONLY.

BARRED PLYMOUTH ROCKS

OLD LADY BEAUTIFUL was perhaps one of the two greatest females yet shown at Madison Square Garden. Her progeny has produced and reproduced until my pullet-bred line (and which, by the way, is all I breed) has attained its present high position among the various strains of Barred Rocks.

At State and National Meets of the American Barred Rock Club the "Lady Beautiful Strain" has won high honors.

LADY BEAUTIFUL birds won at Baltimore as follows: 1st, 3rd and 5th hens; 1st, 2nd and 5th pullets; 1st and 3rd cocks; 1st and 2nd cockerels.

STOCK—Always some choice pullet-bred males for disposal to the discriminating purchaser.

C. N. MYERS

and carried out as intended is expected to prove of the utmost value, not only to the Arizona poultry raiser and the southwest, but to the entire district west of the Rocky Mountains. Rations are being fed that are easily obtainable, most of the ingredients being grown in the southwestern states.

Particular attention is paid to the housing problem, as it is just as vital in this section of the country to house birds properly as it is in Maine or Min-

nesota. That this work is a benefit to all parts of the United States is explained, in a way, from the large number of inquiries coming to the station from all parts of the country asking about conditions in the southwest and on the Pacific coast.

In the last few days we have answered letters from England, Connecticut, New York, New Jersey, Montana, California, and large numbers from Arizona and Texas, in regard to various phases of the poultry industry, and from many people interested in locating in the southwest or on the Pacific coast to engage in the poultry business. Every effort is made to answer the questions in as complete a manner as possible. Bulletins are distributed to applicants for information.

May Some Day Be a Great Poultry Section.

There seems to be no question among those who are posted on the poultry conditions throughout the country as to the fact that the southwest section of the United States, in connection with the Pacific Coast states, offers nearly ideal conditions for the growing of poultry.

There is no section of the world, I believe, where turkey raising can be so

successfully conducted as in the southwest. With the dry climate and sunny days, turkeys can be most profitably raised. For the poultry man or woman there can be no question as to the possibility in this branch of farm life in this territory; one can work out of doors here practically every day in the year. There is no extreme cold weather to contend with, and conditions for doing the labor are nearly ideal.

We believe that the great southwest

The Five Brown Leghorn Hens That Made the World's Record at the American Egg-Laying Contest, Laying 149 Eggs in a Single Month. Owned by H. V. Tormohlen, Box 2, Portland, Ind.

is destined to be the big poultry raising section of the United States; we are also of the firm opinion that within the next few years this same southwest will produce the greatest bulk of the good old Thanksgiving turkey. With the long growing seasons here, and the ease with which labor may be performed the year round, there is no reason why these conditions cannot prevail. The territory particularly served by the Glendale station consists of the states of California, Nevada, southern Utah, Arizona, New Mexico and Texas. All the work is done with the idea of fitting the conditions and needs of this territory.

The Glendale station, we believe, is destined to carry on a work which never has been duplicated. Green feed is more easily obtained in this district than in many sections of the country, for the reason that much of this district has large areas of irrigated land where alfalfa is easily grown and the sorghum grains, such as feterita, hegaria, milo maize and kafir, grow to perfection. Wheat, oats and barley produce splendid crops and of high grade analysis, thus providing the elements for making feedstuffs for poultry at prices that will compare favorably with those in other sections of the country.

Showing back and end of building on Alamo Ranch, west of Glendale, Arizona. In hot summer months these openings are not closed night or day.

In much of the district the poultry business is in its infancy even as a part of the farm animal husbandry. Much educational work is being done by the animal husbandry divisions of the different state agricultural colleges, and with the addition of the U. S. Poultry Experiment Station we can see rapid strides in this industry in the near future.

Better Stock and Methods Needed.

There is a great demand in the southwest for Standardbred poultry. One dealer in poultry supplies in a nearby town has an order for four thousand laying hens. As the industry progresses better marketing facilities will be needed and no doubt will be developed. In some districts of this southwest territory there already are large co-operative poultry associations for the marketing of eggs and poultry, and also for the manufacture of feedstuffs. More and more the farmers are learning the value of Standardbred stock and are realizing the fact that better stock pays best in all lines of animal husbandry; they are learning that good stock, good feeding methods and good housing will make profitable poultry keeping and will bring a good revenue to those engaged in it, whether as a commercial enterprise or a part of the farm industry. Slipshod methods, inferior stock and poor feeding are a money-losing game. The main work of the Glendale station is experimental work along breeding and feeding lines; the farmers must be shown, and

103-DEGREE INCUBATOR

THE 103-DEGREE INCUBATOR

Hatches everywhere, strong, healthy chicks that will live, because of many new patented improvements.

The Most Wonderful Incubator Invention Ever Thought Of
The Tilting Chimney—biggest incubator improvement in years—controls the heat before it enters the boiler, not afterwards. Impossible to overheat or underheat the eggs—guaranteed 103 degrees all the time. No need for an incubator cellar, any room will do. No fuss or worry, no getting up in the night, only one regulation. Guaranteed fully automatic.

Patented Two-Circuit Hot Water Heating System
 The first really effective hot water heating system. Every cubic inch of the egg cabinet always at the same even temperature. Forces the water to keep busy every minute, no hot spots or cold spots.

Perfect Ventilation Guaranteed
 The combination of the *Tilting Chimney* and *Two-Circuit Hot Water Heating System* makes it possible to thoroughly ventilate every part of the egg cabinet at all times. 103-Degree Incubators are guaranteed entirely free from odor.

Four sizes. There is a 103-Degree for every poultry raiser. 103-Degree Incubators get results anywhere. Guaranteed to adjust temperature variations of 66 degrees between high and low.

One Hatch Free
 enables you to prove what others merely claim. All 103-Degree Incubators carry the most liberal guarantee ever made.

RAISE 90% TO 100% OF YOUR CHICKS

KEEP YOUR CHICKS ALIVE. OTHERS ARE DOING IT; SO CAN YOU.

Don't let your chicks die with white diarrhea, gapes, going light, weak legs, stunted, not developing; give them Wacker's Chick Tablets in the water from the start, then watch 'em grow. By using these tablets you make chick raising a pleasure.

BETTER THAN GREEN FOOD

Just dissolve WACKER'S B-T-G-F TABLETS in the drinking water. Your chickens will be in prime condition, and an increased egg production will result. No meat scraps are necessary. If you are not satisfied we will return your money.

ROUP WILL NOT DEVELOP

in your flock if you watch the chickens' eyes. As soon as they begin to water or small bubbles form in the corners or the nose begins to run, give them WACKER'S ROUP TABLETS. You can throw the axe away. **MONEY BACK IF NOT SATISFIED.**

All Tablets, 300, 75c; 1,300, \$2.50; 5,000, \$7.50. Positively Sold Nowhere Else.

at Kansas City, Mo. State and Nebraska State Shows Their 1920-21 record at these shows, including the National Club Exhibit, the greatest of the year, on top of their past records at Pittsburgh, Pa. and other big Eastern shows, surely proves them the best, and truly America's Foremost Strain. 12 fine quality breeding males left at \$10 to \$25. Eggs from 3 select pens at \$5 per 15. All unhatched eggs returned are replaced free. Mating Catalog free. **M. P. Cleary, Office, 4029 Holmes, Kansas City, Mo.**

they must be shown on the pocketbook side.

There are also at the U. S. Poultry Experiment Station a number of ostriches. These are the birds which were taken over from the old ostrich farm, and perhaps today comprise the finest flock of South African and Nubian birds in America. While this is not the main work at the station, we are still working with the ostriches on breeding for better feather production and surer methods of raising the young.

Visitors come daily to the Glendale station to get information as to how best to care for their flocks of poultry so as to make the most profit with them, and there is a growing interest throughout the entire southwest in learning how to breed and care for poultry. There has been a feeling among some poultrymen that the American breeds would not do so well in the warmer climates as would the Mediterranean or lighter breeds. We believe this idea is erroneous; at least this has been proved so thus far at the Glendale station, also by observations of the writer in his government work with poultry interests in the Imperial Valley in the southeastern section of California, and in other districts where hot summers prevail. In fact, we have found that the American breeds lay fully as well through the hot months as do the Mediterraneans.

At the end of our experimental year, November 30, 1921, we hope to have much valuable data to present to the public on conditions and experimental work in the southwest. Inquiries addressed to the U. S. Poultry Experiment Station, Glendale, Arizona, will be answered with pleasure.

Water Glass and Limewater for Preserving Eggs.

Experiments in preserving eggs have been conducted by the United States Department of Agriculture in the last two years, testing different strength solutions of water glass, limewater and various commercial preparations. The best and most economical results have been obtained by using one part of water glass to nine parts of water. Just as good results have been obtained with limewater as with water glass, and in many sections limewater is much less expensive.

When salt was used with the limewater the results were about the same as without the salt, showing no advantage in using salt. None of the commercial preparations, all of which called for smearing the eggs with the preparations, gave results that were at all satisfactory. When the water glass and limewater solutions were kept over and used again for the second year, the eggs kept comparatively well, but not so well as in fresh solution. In most cases the old solutions were not in good enough condition to use again after they had been kept one year. Under usual conditions, it does not appear advisable to use the water glass or limewater solution again for the second year.

In testing containers, the best results were obtained with stone crocks, but the water-glass solution was perfectly satisfactory in well galvanized receptacles, such as garbage cans or ash cans. Limewater corroded the galvanized receptacles and gave satisfactory results only in the earthenware crocks. Wooden kegs and other wooden containers did not give satisfactory results with any of the solutions.

The interest in preserving eggs has been very marked during the last two years and a very large number of letters giving directions for preserving eggs have been distributed, including that a great many families are preserving eggs for home use to help keep down the cost of living.

Other things being equal, the best brooder is the one that provides ample heat for the chicks, but does not overheat the house or coop in which it is located. Too much heat and too little exercise, both of which are likely to occur in artificial brooding, are both conducive to weak legs, and generally debilitated undesirable youngsters.

Again—for the Ninth Time MY SILVER CAMPINES ARE CHAMPIONS

At the Coliseum, Chicago, Dec. 1 to 6, 1920, I Won

Cocks	Hens	Cockerels	Pullets	Old Pen	Young Pen
1	1	1	1	1	1
2	2	2	3	1	1
		5	4		

I have had 62 males placed under ribbons at the Coliseum Show in last nine years. During the same period, I have had 147 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. I have the largest plant devoted to the raising of exhibition and high egg record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous.

FRANK E. HERING, Desk B., SOUTH BEND, IND

Two Ways to Know a Layer

You can find all sorts of Leghorns for sale. Some are good, some fair and some worth little as layers, although they may be mighty good lookers.

But you have two ways of telling whether Leghorns are good.

One way is to buy eggs or chicks, raise them, and next year test them out to see whether they are real layers. But that's *hindsight*—a costly method and you loose months and years.

The second way is the simplest and safest. Be sure that the Leghorns you get are Tormohlen's famous "Everlay" family of Brown Leghorns. That's *Foresight*. "Everlay" Brown Leghorn stock, eggs and chicks are always plainly labeled under the trade-mark name. When you see that label it is proof-positive of Leghorns bred with greatest laying qualities, bred for a score of years with that one thought uppermost.

They are moderately priced and cheapest in the end for they are such economical money-makers. They made a World's Record at the great American Egg-Laying Contest. Greatest winners three years straight, Madison Square Garden, N. Y.

24-page catalog tells the story of this wonderful family of Leghorns—sent free. Get it before placing your order.

H. V. TORMOHLN

Box 2

PORTLAND, INDIANA

Puritas Springs S.C. WHITE LEGHORNS

Trappened for ten years without missing one day. They are the World's GREATEST WINTER LAYERS.

(DON'T READ THIS)

Clearfield, Pa., January 4, 1921.
Mr. S. J. Schenk: I just thought I would drop you a few lines to let you know what I think of your S. C. W. Leghorns. Listen, brother, they have got anything stopped I ever saw or ever heard of. They sure are real egg machines; why, they don't even know enough to rest a few days after laying so good. Your 33 pullets for December, 1920, laid 815 eggs, and one pullet we call Lady Snow laid 28 eggs in December. This is hard to believe, but we trapped and have the proof. There was a poultry fancier here at my place on Sunday and he asked me where I got those birds and I told him, and he said he never saw birds lay like these do. He offered me \$25.00 for Lady Snow, but I couldn't part with her, as she is sort of a pet to me. I have 35 pullets from a farm that breeds the English strain. For December, 1920, they laid 655 eggs, and your 33 pullets for December, 1920, laid 815 eggs, so you can see the difference in the kind of laying. Both had the same kind of feed and care. Next year I will call on you for a good rooster. I remain, Cyrus M. Woodell.

LATER REPORT FOR JANUARY, 1921.

Clearfield, Pa., February 16, 1921.
Mr. S. J. Schenk: I will now report for January from your 33 pullets. They averaged 25 eggs each for the month of January, 1921. I have another pet among these 33 pullets; I call her Snoop. She laid 27 eggs in 31 days, so you can see they are all record layers. Lady Snow looks just like your Lady Did. In December she laid 28 eggs and this month of January she laid 25 eggs, and I believe in a year's laying she will come pretty close to your birds in laying, as they have been very strong and never have been sick a day since they were hatched. I remain your satisfied customer, CYRUS M. WOODELL.

We thank you for reading the above letters. We receive letters like these every day, which goes to show that we have the real layers. If you want Baby Chicks, Hatching Eggs or Stock that you can be proud of, get Puritas Springs strain. Send for our big free 1921 catalog; it gives prices of Eggs, Chicks and Stock and much other information. We can supply you with Chicks or Eggs any time in April or May—the two best months of the year. Send for a catalog today; don't delay!

Lady Puritas

BUYING EGGS FOR HATCHING.

This is the season when every person with a good supply of red blood in his system has a longing to grow something, to plant and bring forth a new crop. Spring is the season of optimism, and our enthusiasm for life is born anew. Nature gives herself to the wonderful process of reproduction, and we poultrymen turn our thoughts to the hatch-

ing of eggs and bringing forth a new crop of chickens.

It is always a pleasure to buy a setting of eggs and hatch from them chicks which develop into stock that will prove its worth as utility birds, or as exhibition birds. At this time I will take up the hatching of eggs which were bought with the intention of strengthening the blood lines which we now have, or as a foundation upon which to build.

Let us right here understand that those who are engaged in the poultry business, as a hobby, as a side line, or as a business from which they obtain their living, are just as honest as those who are engaged in any other line. When a breeder has gathered, packed, and delivered, a setting of eggs to the express company, he has done all that he can do, for, of course, he would not ship them unless the fertility was O. K.

MADISON SQUARE GARDEN, NEW YORK, January 20, 1921.	
Cocks	1-2
Cockerels	5
Hens	4
Pullets	1-4
Old Pens	1
Young Pens	3

Shape Special and Color.
Special on 1st Cock.

Our strain of White Orpingtons is linebred on scientific lines, no hap-hazard breeding. That accounts for our breeding First Cockerel at Madison Square Garden in 1914, 1915, 1916, 1917, 1918, 1919, 1920, and being able to win Champion Pen at both Chicago Coliseum and The Garden this season, containing our famous hen PAULINE, egg record 245; also Hen No. 61, egg record 215, proving again that the highest exhibition quality stock can also be high egg producers if bred right.

"Proven Leader" White Orpingtons have now become the dependable, established strain, winning regularly for our customers in both United States and Canada, as well as for ourselves.

The vigor and vitality of our birds assures us of the excellent fertility, which we now have.

We are prepared to make prompt shipment of both eggs and chicks, all of which we send **prepaid**, guaranteeing safe delivery. Be sure to write for our catalog and mating list.

THE MORRIS POULTRY FARM Harold Rawnsley, Mgr. LEBANON, OHIO

WORLD'S CHAMPION BUFF WYANDOTTES

Free Book Tells How

What's a CAPON and Why?

A book that explains everything you will ever want to know about CAPONS. 50 pictures from life that show each step in the operation. List of Capon Dealers' addresses. Tells how to prevent "Slips" where to get the best and cheapest capon tools. Capons are immense eating. Big profits realized. Get wise. This book tells how. Copyrighted new and revised edition. Regular 50c copy, prepaid to your address (a short time only) for a Dime in coin or stamps. GEORGE BEUOY, R. R. No. 7, CEDAR VALE, KANS.

It is then up to the buyer to so handle those eggs as to bring out all that it is possible for the eggs to produce. There is always one best bird from every mating, and the buyer stands a chance to get that best bird. It is necessary for him to know the breed well enough to recognize this quality when he has it, or if he is not familiar with such things it is then time to call in some one who can explain to him just the qualities he has.

What is a good hatch is a question that calls for much more thought than is usually given to such things. If I can get one good bird from a setting of \$10 eggs I am satisfied. More good birds from a setting of eggs are usually expected, and in many cases obtained. But did you ever hear of a buyer who had produced a \$25, a \$50, or \$100 bird from a setting of eggs writing and telling the seller he was in his debt? No, I do not think you have.

Personally I have had both good and poor hatches from eggs purchased, but the good hatches are so much more common that it takes a poor hatch once in a while to make one really appreciate the good ones.

The past season I purchased a setting of eggs from each of three different breeders. From the first shipment I got ten chicks from 15 eggs and raised them all. Four were cockerels, and six were pullets. Two of the cockerels sold for enough to pay the cost of all the eggs. One had twisted feathers in his wings, not an unusual thing in the breed I have. I ate him. This left me with one cockerel and six beautiful females, the cockerel is judged by good judges to be worth \$50 and the six females are worth \$50 as breeders.

From the next setting, same breed, I hatched three chicks, and two died. The other was so weak that I killed him. I reported the results to the breeder from whom I purchased the eggs, and he kindly sent me a duplicate setting. I hatched two from this setting, but they did not amount to anything. The third setting gave me ten chicks of which six were cockerels, and four were pullets; and as in the case of the chicks from the first setting, I raised them all. Two of the cockerels I ate, and am holding the other two hoping they will make something worth while. Two of the pullets are worthless; but one of the remaining trio is worth all I paid for the eggs and the other is a good bird. Upon the whole, the eggs I purchased paid me as an investment and paid big.

If I had only bought the one setting which proved a failure I probably should have been very much dissatisfied. Yet I believe the breeder who sold me those eggs tried just as hard to give me my money's worth as the others. But it did not turn out just as we wished.

As is usually my custom I trapnest my birds, and the record of one hen last season gave me something to think about, I hatched 22 chicks from her eggs and 20 of them were cockerels and two were pullets. Now it would be almost impossible to get a setting of eggs all from one female, but suppose one had several that reproduced the sex in this ratio, and one had bought the eggs! This was the only female which gave me such results. I will mention one other which gave me fifteen chicks, ten pullets and five cock-

Buy Lord Farms

May, June and July Leghorn Chicks

We are one of the most experienced Leghorn Farms in the United States—in fact we are one of the largest breeders of White Leghorns in the United States. When we tell you to buy chicks during these months we are giving you good advice.

Earlier hatched Leghorns in a great many cases become stale from good laying before the real winter gets started, and prove indifferent layers on this account. Lord Farms May hatched Leghorns come to laying from the last of September to the last of October. ISN'T THIS AN IDEAL TIME FOR PULLETS TO BEGIN TO LAY?

June hatched Leghorns commence laying the latter part of October and should be in full lay before Thanksgiving. ISN'T THIS AN IDEAL TIME FOR PULLETS TO BEGIN TO LAY?

Last year we raised 1,200 pullets hatched July 2nd. We got some eggs from these birds in November. We got a whole lot in December, and from January 1st to March 15th, 280 of these pullets in one house, gave us an egg yield never less than 50%—some days we got as high as 210 eggs.

If you were going to enter a laying contest and was out to make a record in twelve months you would select birds hatched in either May or June. Why not run your own egg contest on your own farm? Get the idea out of your head that you have got to have April Leghorns. Our years and years of experience has proved to us that May hatched Leghorns pay better than April Leghorns. This advice is of no use to breeders of American or Asiatic varieties. You must hatch those birds earlier to get a good winter egg yield.

The Lord Farms believe in raising most of their pullets in February or early March, or not raise pullets again until May and June.

Grade A White Leghorn Chicks, \$28.00 per 100

Grade B White Leghorn Chicks, 25.00 per 100

PULLETS, PULLETS, PULLETS

March 15th the Lord Farms had 30,000 single combed White Leghorn chicks in their brooder houses. Thousands of these are for sale at eight to ten weeks old in May and early June. Thousands again for sale the last of July and August. No runts, no culls, every pullet guaranteed to be satisfactory to the purchaser at the time of sale.

Those who are contemplating entering in the poultry business on a large scale should communicate with the Lord Farms. There is no other farm in the Eastern or Middle States that can serve you both in quantity and quality to your better advantage.

All our pullets are raised this season on a brand new 260 acre farm. We have already booked orders for several thousands.

At Last! A Safe Package for Settings of Eggs

"PLYMOUTH PACKAGES"—used exclusively by many successful breeders—are the type recommended by poultry schools, journals and breeders. Not a makeshift nor an experiment, but a distinctive colored basket made especially for poultrymen. Supplied in three sizes for one or two settings, fifty eggs and one hundred eggs. Produced in a factory that has made good packages for three generations. Can be used for all sizes of eggs. Write for circular, prices and "The Best Way to Ship Settings of Eggs."

The Edgerton Manufacturing Company, Dept. A, Plymouth, Indiana

erels. Is this matter of sex inherited? Can a breeder develop a strain that will produce more pullets than cockerels by pedigreeing? H. P. Winslow.

GROWING CHICKS.

In raising chicks many people think it simply means to pull them through the first month and then let them do the best they can. This is the wrong idea. To grow chicks successfully they must be given constant attention.

I have had good success in raising chicks. My cockerels last year gained one and a half pounds each month and the pullets a pound.

All of my chicks are hatched and brooded by hens in small coops. The coops are placed on a range of about fifty acres when the chicks are about three or four weeks old.

When the chicks are twenty-four hours old I place a small pan of buttermilk before them. They are given nothing else for twelve hours, at the end of which they are given a light feeding of fresh corn bread.

The second day they are fed corn bread three times in the morning and twice in the afternoon.

The third day they are fed corn bread same as second day. Oatmeal is placed in a shallow pan where the chicks may eat all they wish. Buttermilk is kept before them, but no water is given. Feed this ration until three weeks of age.

From now until two months of age they are fed as follows:

Wheat fed in litter in the morning. Cornbread fed on boards at noon. Wheat and fine cracked corn fed in litter at night.

Oyster shells, charcoal, and oatmeal are fed in separate self-feeders.

Buttermilk is before them all the time. Water is given in afternoon.

When the chicks are two months old all the cockerels and pullets are culled. Only the very best ones are kept. The remaining cockerels are allowed to run with the pullets as long as they don't bother them.

From now until maturity the chicks are fed in the following manner:

For the first feed in the morning take oats, which have been soaked all night before, and scatter them upon a piece of ground that has previously been spaded. Now take a hoe and mix these oats thoroughly with the soil. When the chicks see the oats they will go to work and get every one. The soil that sticks to the oats will keep the digestive organs of the chicks clean and free from disease.

The second feed is fed at noon and consists of three parts of shorts, three parts of bran and one part of tankage mixed with water and fed in clean, sweet troughs.

The next feed is fed at 5:30. It consists of one part of wheat and one part of cracked corn fed in a litter about six inches deep.

Both buttermilk and fresh water are before the chicks at all times.

A dry mash, the same as fed at noon, is fed in a self-feeder. Oyster shells and charcoal are kept in two other self-feeders.

During July and August sprouted oats are fed at 2:30 in the afternoon.

Once each week all the coops are cleaned and disinfected. Dust baths with louse powder mixed in the dust keeps the lice off the bodies of the chicks. Howard Westfall, Indiana.

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles should be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

GETTING GOOD HATCHES WITH INCUBATORS.

First Prize Article.

March and April sees the hatching of the bulk of next winter's layers. May hatched Mediterraneans will perhaps develop early enough to be profitable, but up here in New York state I do not find it easy to get them well started in laying before cold weather, if they are hatched much later than May 1.

The first thing that is necessary to be successful is good, strong, healthy breeders; that is, birds that are fully developed and free from disease.

Eggs for hatching should be from strong, healthy stock, and to hatch strong chicks the eggs should not be over ten days old at time of setting. Eggs for incubation should never be placed small end down, as it is not the natural position of the egg. If the eggs must be kept for some days, they should be turned frequently to prevent the contents settling on one side. Have the temperature of the room the eggs are kept in about 50 degrees, plenty of ventilation, and the eggs covered with a cloth to prevent drying out.

Eggs produced under natural conditions are almost always easily hatched,

and nine times out of ten failures are due to improper care the first week of incubation.

If you desire an extra good hatch, it will pay you to look all your eggs over carefully before placing them in the machine. Discard all that show a mottled shell and those of very thin shell. Use only eggs of uniform thickness and size, and avoid all small and extra large ones and those with irregular shapes. Careful attention at this time will prevent so large a number of infertile eggs at testing time and will give you a larger percentage of strong, lively chicks.

It is a good plan to run the incubator for several days, and you will then know that everything is in good working order before placing the eggs in same.

The modern incubator, equipped with a reliable heat regulator and an absolutely accurate thermometer, is a wonderful hatching machine. Success in hatching depends considerably upon a correct, uniform temperature being maintained throughout the incubation period. With an unreliable and inaccurate thermometer, the best incubator becomes no better than a soap box as a hatcher.

Before placing eggs in incubator, I

A Straight Draught Without Any Turns

Cantleak Chimney Flange

Patent Applied For

can be set up on any roof and it will give you straight draught, from your fire up thru your chimney, and a straight draught without any turns is what you want to keep a fire going properly.

Lord Farms, the inventors and manufacturers of the Cantleak Chimney Flange, have been experimenting for a number of years and at last have found the way to obtain a straight and steady draught for the coal burning brooders and mammoth incubators, or wherever a fire is used in an out building.

No wire stays to support chimney—easy to slip it into place and it will stay there. Takes less than two minutes to set up and take down. Write today for one and forget your chimney troubles.

DON'T READ THIS IF YOU DO NOT LIKE

SINGLE COMB WHITE LEGHORNS

TOM BARRON STRAIN

Read What Our Pullets Did at the Egg Laying Contest, Lincoln, Neb.

The great big, long body, wide back, deep keel, large posterior and large beautiful drooping combs. This is the kind that is bred on the BELLA VISTA POULTRY FARM, KIMMSWICK, MISSOURI; the kind that made high records and won scores of blue ribbons for having laid 25 eggs or more per month, at the egg laying contests in the past few years, at Mountain Grove, Mo., Leavenworth, Kans. and Lincoln, Neb., with records of 200 to 225 eggs during the year.

At the Nebraska National Egg Laying Contest, November, 1, 1919 to October 31, 1920, LADY BELLA laid 255 eggs in a pen with 249 other pullets. Our entry of 9 birds (one of the ten having died after laying 1 egg first month) was sixth pen for the year out of 98 entries, 250 pullets in each pen. Our pen was first for October, 1920. Note:—9 hens only against many pens of 10 hens each.

The kind we must have to supply our large demand for select table eggs for our private trade in St. Louis, Mo. EVERY DAY IN THE YEAR. Raised on free range, early matured commence to lay at four and a half months old and late molters. IT SHOWS THE WAY THEY ARE BRED AND CARED FOR.

We have 600 like these in our special breeding pens this season, not a cull among them. The business hen. The money maker. The mortgage lifter. The kind you should raise. We have been at it ten years. Prominent poultrymen say they are the best and healthiest large flock of S. C. White Leghorns they have ever seen.

Eggs for hatching \$3.00 per 15; \$12.00 per 100. Day-Old-Chicks 30c each in lots of 25 or over. Hens for breeders two years old \$4.00 each, after June 1st, \$3.00. March 1920 hatched pullets, \$5.00 each, after June 1st, \$4.00, as good as you ever laid eyes on.

Eggs from our pen of trapped-nest hens, which were in the egg laying contests the past year, 50c each. After May 1st, 25c each. If you want to raise this kind, better order now, as we could not supply half the eggs and stock we got orders for last season. If interested, write for catalog.

BELLA VISTA POULTRY FARM, Box A., KIMMSWICK, MO.

JERSEY BLACK GIANTS

THE GREATEST ALL-PURPOSE VARIETY ON EARTH.

If you want to make a reputation as a breeder and exhibitor of exhibition poultry, why not take up a variety that every Tom, Dick and Harry are not breeding and exhibiting—in other words, start with a comparatively newer breed and become a leader with them. Such are the possibilities with the JERSEY BLACK GIANTS.

FOR BEAUTY, UNSURPASSED—COMMERCIAL VALUE, UNEQUALED.

The M. and M. Strain are originated by Marcy Farm. We have introduced the Jersey Black Giants to the American public. So come to headquarters for your start.

AT MADISON SQUARE GARDEN—AT BOSTON—

and a score of other shows, the highest honors went to Marcy Farm exhibits the past show season. Leaders everywhere—New York State, Hanover Fanciers', Hagerstown, Allentown, Trenton, and in Customers' hands at every great exhibition in America.

EGGS FOR HATCHING ONLY.

BLACK GIANTS—From Pen A and B, Madison Square Garden and Boston winners, \$20.00 per 15 eggs; from Pens C and D, Trenton and New York State (Syracuse) winners, \$10.00 per 15 eggs; from Utility or Farm Flock, \$6.00 per 15 eggs. **DARK CORNISH**—\$20.00 and \$10.00 per 15 eggs only.

Order direct from this adv. or disappointment may be your lot. All orders booked in rotation as received. 117 Prizes, 2 Specials, 2 Best Displays and American Poultry Association Award of Merit all in less than 5 months. Complete catalog with cuts of winners, etc., ready March 30th.

MARCY FARM P. O. Box 100 MATAWAN, N. J.

Wyandotte Standard and Breed Book

All Wyandotte varieties—Silver, Golden, White, Buff, Silver Penciled, Partridge, Columbian and Black.

The book includes the entire official Standard of Perfection on each variety; the Official Score Card, Explanation of Scale of Points, Instructions to Judges, General Disqualifications, Cutting for Defects, Standard Measurements, Symmetry, Color Terms, etc.

Breeding Standard Fowls: This includes Breeding of Standard Fowls, Does "Like Produce Like?" Why Fowls Differ in Breeding Value, Why the Male is "Half the Flock," Breeding from the Best, Double Mating, Characters Controlled by Sire and Dam, Mating to Offset Defects, Importance of Constitutional Vigor and How to Preserve it, Breeding for Color in Plumage, Relation of Under Color to Surface Color, Importance of Trap-nest-

These and all other subjects are treated in a plain, easy-to-understand manner by the best authorities and the book is fully illustrated. Every breeder of Wyandottes, any variety, should have this book. The pictures alone are worth many times the price. Don't neglect your opportunity to get ahead—send your order today.

spray or paint the inside of the machine with a solution of 1 tablespoon of a cresol product to 1 quart of water. This spraying will reduce the temperature, but it will do no harm; let the regulator alone and the heat will work up to where you wish it to be. I have had good success by dipping each egg in the above solution and then placing the eggs in the incubator.

My experience has covered a number of years, during which time I have operated almost all types of modern incubators, both hot water and hot air. I find both will give satisfactory results if handled properly and the instructions of the manufacturers followed carefully.

Turn the Eggs Regularly.

Have regular times for turning and cooling the eggs and filling the lamps.

I start to turn the eggs on the evening of the third day, and turn them morning and evening until the eighteenth day, after which the eggs are not disturbed until the hatch is well cleaned up. For a successful hatch it is necessary to cool the eggs daily. The first week they receive sufficient cooling while being turned. I test the eggs on the night of the sixth day and on the morning of the seventh day. I begin cooling them, letting them remain out of the incubator until when I shut one eye and place an egg to the lid I find that it has lost the burning heat. Then I put the eggs back.

In conducting various tests throughout the hatching seasons of past years, I have arrived at the conclusion that in order to secure a uniform hatch of good strong chicks it is necessary that every egg be turned morning and evening, and the eggs nearest the edge of tray moved to center and those in the center moved to the edge of the tray. In the natural state the hen can be seen stirring the eggs frequently and changing them from the center to the edge of the nest.

I have never found it necessary to supply moisture to any of the hot water machines, but find with the hot air type, if moisture is added about the seventeenth day by placing pans of water under the trays, removing same quickly at pipping time, and sprinkling eggs with lots of water, a good hatch will be the result. If the chicks are not allowed to drop down into the nursery trap, the water pans may be left there throughout the hatch, and no sprinkling will be necessary.

The second test is made on the fourteenth day, and any eggs that do not show strong live chicks are taken out and more room is left for the chicks that do hatch. On a tray that is not crowded the eggs can be spread out well and there will not be the danger of them getting capped which a chick that has hatched has left on the tray. If another hatching egg is capped it may smother the chick, as sometimes happens when it is working its way out of the shell.

Be Sure Machine Is Running Right.

The first week I maintain a temperature of 102 degrees, and as soon as the eggs begin to show life I test out two eggs showing strong, healthy germs, with good blood lines running from center of germ. I place the thermometer between these eggs to be sure they are developing properly, and, if so, keep the instrument there throughout the hatch.

BABY CHICKS

Book your order now for 1921 delivery. 25 percent deposit books order for any shipping date. 10,000 chicks every Tuesday from March 1st. Every chick is hatched from eggs of culled flocks that have been selected by the lay bone method or Hogan system and for Standard qualifications.

SIEB'S HATCHERY

LINCOLN, ILL.

ARNOLD'S S. C. BUFF LEGHORNS

We started breeding Buff Leghorns in 1890. But never before have we put together four such wonderful matings as we have for 1921. Long backs, low tails, White Leghorn quality combs, even golden buff, well up on legs are characteristics of these four matings. No breeder on earth has four better matings. Cockerels and pullets for sale.

ARNOLD'S S. C. RHODE ISLAND REDS

OWEN FARMS STRAIN PURE. This is our third year in this grand variety. The past two seasons we bought eggs from matings headed by First Prize Males at Madison Square Garden, and our birds are full of their line quality. In fact we have four remarkable quality matings. Every bird in these four matings is either a son, daughter or grandson or granddaughter of a First Prize male at Madison Square Garden. A few cockerels of high quality for sale. No chicks for sale. Eggs from both varieties from eight matings as laid, \$10.00 for 15 (no discount), ten chicks to a setting guaranteed. All eggs sent prepaid by parcel post.

PREMIER BUFF WYANDOTTES

Only selected, choice specimens of large size and good type and color in my yards. Record layers of large eggs. Eggs from large, typy hens, \$10 per 15. Baby chicks from same, \$2 each. Eggs from mature rich Buff pullets, \$5 per 15. Baby chicks from same, \$1 each. Safe delivery guaranteed.

MRS. ELY BROYLES, CARROLLTON, MO.

By following this plan you are thus assured of an even temperature and will not experience the sudden drop when the instrument is resting on an egg with a weak germ that finally dies.

The second week I keep the temperature at 103 degrees. The third week I carry a temperature of 103, and when the eggs begin to pip I keep the thermometer between 104 and 105. Do not lose your courage and think that the chicks will roast or smother at this heat, as this is the proper temperature that bursts out chicks full of life.

The temperature will be seen to drop a short time after the first chicks are out, and right at this time it is well to move up the flame in the lamp a very little so that the temperature will remain at 105 until the hatch is well over. I find that if this scale of temperature is maintained throughout the hatch you will be rewarded with a machine full of chicks with lots of vitality and free from cripples, and a very small number that are dead in the shell. Strong, healthy breeding stock and proper handling of the eggs in the incubator means vitality in the chick when it leaves the shell.

First Care of Chicks After Hatching.

The chicks now hatched are ready for the brooder. Right now and for the next ten days is a very critical time in their lives. Great care must be taken that none are chilled in the trip from the incubator to the brooder. They can be moved successfully if placed in chick boxes or a basket with a flannel covering to place over their backs. The temperature under the brooder should range from 95 to 100 degrees to start with, and then gradually be reduced as the chicks grow older. You will save a great loss by running your brooding equipment several days before the chicks come, to see that it is heating and regulating properly.

I have had good success with the small oil burning brooders, but for flocks of from 200 to 1,000 I prefer the large colony brooder stoves with galvanized hover. These brooders distribute a uniform heat over the backs of the chicks and there is not the crowding that you will experience in the small, poorly ventilated brooders.

As each chick is taken from box or basket, to be placed under the brooder, its bill is dipped into a cup or pan of lukewarm buttermilk. Fountains of water and buttermilk are within easy reach of the chicks from then on. Without doubt, the buttermilk diet from the start goes a great way to prevent white diarrhea.

Shallow boxes of sand are provided from the start, and no commercial grit is given until the chicks are ten days old. The chicks are fed no feed other than the buttermilk until they are forty-eight hours old. About four o'clock of the second day they are given their first feed, which consists of 1 part good wheat bran and 2 parts rolled oats, to which has been added a very little charcoal and fine granulated bone.

They are fed this mixture until they are seven days old. They also have all the buttermilk and water they can drink. At 10 A.M. and 3 P.M. the seventh day they are given a very little commercial chick grain, scattered in the litter of alfalfa or fine cut straw, with rolled oats and bran for the other three feedings.

Postage prepaid. None shipped C. O. D.

Baby chicks, certified for high egg production, \$50 per 100. Eggs, certified stock, \$25 per 100. Baby chicks, certified stock, \$30 per 100. Eggs, uncertified stock, \$15 per 100.

The rolled oats and bran are gradually reduced until only the chick grain is fed, except at noon, when the rolled oats and bran are given until the chicks are ten days old. From then on I feed a mixture of ½ part rolled oats, 1 part corn meal, 1 part shorts and 2 parts wheat bran; also some infertile eggs, hard boiled and chopped fine. This is fed at noon only and is placed in troughs or hoppers so that the chicks can eat all they want for about one-half hour.

Brooder chicks suffer considerably in health and growth for want of sufficient green food, and there are few of those who rear chicks who seem to be fully aware of the benefits which growing birds derive from a regular and un-failing supply of this necessary article of diet. Observation teaches us that chicks are exceedingly fond of green stuff in every form, and that it is good for them there can be little doubt. If the brooder is moved from the ground upon which it has stood for a few days to a fresh patch of short green grass it will be seen that the chicks at once will proceed to devour the tender shoots until they have made their run quite bare.

If the chicks must be confined in bare runs, provision should be made for supplying them with plenty of green food every day in the form of sprouted oats, lettuce, Swiss chard or raw sliced potatoes.

Give the chicks plenty of exercise. Make them work for all the scratch grain, and you will be rewarded with big, healthy broilers and pullets at eight to ten weeks of age.—Charles Franklin Stein, New York.

LICE AND MITES.

Second Prize Article.

Of the various parasites attacking poultry, these two are probably the most common, especially in the farm flock that does not receive the care given the flocks found on the more specialized poultry farms. The presence of these parasites not only results in a decreased egg yield, but also causes a general restlessness among the birds, and in severe cases they may refuse to eat. If young chicks become seriously infected it often results in their death. It is important that the poultryman know something of the difference between these two parasites, because the control measure used is based on certain differences in their life cycle and feeding habits. Following is a discussion of each of these two parasites, with remedies for their control and eradication.

Louse.

The louse ranges from one-sixteenth to one-eighth of an inch in length and is pale yellow or gray in color. It lives on the body of the bird and is very active. This parasite has biting mouth parts and its food consists of the scales, hair and feathers of the body. The louse does not suck the blood of the fowl. Lice are found in greatest numbers around the vent and under the wing. The eggs are commonly called nits, and are fastened in clusters, generally, around the vent. They are small, white, and oblong in shape, and hatch in from six to eight days. They immediately start running and irritating the bird. In about three weeks the lice mature and lay eggs for another brood. They breed very rapidly and it has been

You can both Start and Grow your chicks on this one feed

BLATCHFORD'S CHICK MASH is the *most thoroughly efficient and completely successful STARTING* feed on the market today. No other feed will give chicks the same vigorous, peppy start in life. No other feed will nourish so thoroughly every part of the chick's body, or give them in equal measure the substantial foundation so necessary for future development and growth. No other feed will provide the same protection from white diarrhea, bowel trouble and leg weakness.

Send for a TRIAL Carton —Try it Yourself

If you are raising baby chicks this year you want to raise as near 100% of them as is humanly possible. You do not want to see about half of them die off because they are *improperly* nourished or because they are *under* nourished. That is usually the fate of 40 to 50% of all the chicks that are hatched. But it is an *unnecessary* loss. It can be *prevented* by *starting* and *growing* your baby chicks on *Blatchford's Chick Mash*. You have our assurance for it—also the experience of thousands of users to give it additional emphasis. *Now try it yourself*—in the following inexpensive way.

These are Established Facts

All the above facts *have been proved*. They are the sum total of the actual experience of thousands—*yes, hundreds of thousands*—of users. They have been substantiated by poultry breeders of national reputation—men like Sheppard, Fishel, Poorman, Halbach, Pape. They are the every-day experiences of farmers in all parts of the country, and keepers of back-yard flocks in cities and towns everywhere.

Blatchford's CHICK MASH

(formerly known as Blatchford's Milk Mash)

WE challenge any other feed on the American market to give baby chicks as thoroughly satisfactory a start as they will receive on Blatchford's Chick Mash. Extensive experiments and tests have been made on the Blatchford Experimental Farm with various chick feeds and with hundreds of chicks. The results of these tests together with evidence received from poultrymen located in all parts of the country who have tried other chick starters and growers *prove* conclusively that *Blatchford's Chick Mash* will *start and grow* bigger, stronger, healthier, better chicks than can be started or grown on any other feed.

one feed for starting and growing. This is the *right* way, the sure way, the economical and sensible way.

Here's what users say:

The fact that the HAL-BACH STRAIN White Plymouth Rocks made a World's Record by winning every First, Second, Third, Fourth, and Fifth Prize offered at the last great Chicago National Show, 1921, has undoubtedly been brought to your attention.

You will be especially pleased to learn that all of these birds were grown on Blatchford's Chick Mash, formerly known as Blatchford's Milk Mash. We have been feeding Blatchford's for over five years and have found our chick problems reduced to a minimum by its use. The chicks grow very quickly and evenly. The mortality is very low and I do not believe that there is any other feed that will keep them booming as well right from the start. H. W. Halbach & Sons, Watervord, Wis.

Your Chick Mash is sure a winner. We have had no bowel trouble with our chicks and they seem to grow like weeds. Wm. Langbehn, Avoca, Iowa.

If we can't get your Mash we don't want to raise any chicks. We can't raise them successfully without it. J. H. Vandervort & Son, Sidney Center, N. Y.

Blatchford's is the best we have ever used. We would not attempt to raise chicks without it. H. Cecil Sheppard, Berea, Ohio.

We use lots of Blatchford's. For starting and growing it is unequalled. Chas. G. Pape, Ft. Wayne, Indiana.

We brooded '1700, used Blatchford's and only lost 47. They were the most uniform bunch we ever raised and have made wonderful layers. R. & S. Poultry Ranch, 4th Ave. and H St., Chula Vista, Cal.

4 lb. Trial Carton for Blatchford's Chick Mash 50 cents

Mash is undoubtedly handled by your local feed dealer. Get a supply from him and have it ready to start your chicks as they should be started. If, however, he does not handle it, accept our special introductory offer of a 4 lb. trial carton for 50 cents (shipped anywhere in the United States, all charges prepaid). The only way you can possibly find out how thoroughly efficient Blatchford's Chick Mash really is for starting and growing baby chicks is to *feed* it. This offer makes it possible for you to try it at small expense. It is an offer you should accept at *once*. It will insure you greater success with your chicks this spring than you have ever had before. It will enable you to start your chicks right and grow them rapidly. It will be the best 50 cent investment you have ever made. Use the coupon below. Send it to us *today*. A 4 lb. carton will be sent you immediately.

One feed for BOTH Starting and Growing

You have only to refer to the following letters from users to realize that *one* feed—*Blatchford's Chick Mash*—is thoroughly capable of *both* starting and growing chicks. Also it enables its users to raise a *bigger percentage* of their chicks and to raise them *quicker* and *better* than by any other method. Use this

The "Y" Triangle and the Poultryman

Great Organization Takes Steps to Benefit the Poultry Industry

The Y. M. C. A. triangle is known the world over. It is an emblem of service to mankind. It represents a world-wide organi-

zation which has done and is doing big things for the improvement of men and women.

One side of this "Y" triangle stands for "Mind." And always the Y. M. C. A. has been active in providing education and culture. Its libraries and reading rooms are found in most cities and towns—its lecture courses are notable for the quality of the speakers presented—its educational courses are famed for the practical benefits they bestow.

In its educational work the Y. M. C. A. never aims to supplant established schools and college. Rather, it intends to supplement the work of these institutions and provide instruction for those who cannot, either through lack of time or money, avail themselves of the opportunities offered by the usual educational institutions. And these local Y. M. C. A. schools occupy a high place in public esteem for the amount and character of the good work done.

But there are untold thousands of men and women who cannot avail themselves of the advantages of resident courses of instruction. This is especially true of those who live in small towns and the country districts. And to serve all such, the Y. M. C. A. has organized a great correspondence school under the name of the Extension Division of the United Y. M. C. A. Schools. It is the object of this new work of the "Y" to give education and vocational training by the most approved correspondence method. And these home study courses are open to men and women, young and old, without respect to place of residence, sex, color, or creed.

Further, and highly important to the student, the United Y. M. C. A. Schools are operated for service and not for profit. The Schools are not in any sense a charity. The student pays for his course—but he in turn receives the most interested and capable service—big value for his investment—complete satisfaction.

At present, 167 different courses are offered. One of these is Poultry Husbandry.

In keeping with their invariable policy,

the authorities of the United Y. M. C. A. Schools determined to present the best available instruction in this subject. And it was decided that the new Interstate Poultry School Home Study Course met their rigid requirements. It is this course that poultry students of the United Y. M. C. A. Schools receive. And this notable course can be secured nowhere else.

The active and advisory faculty having control of instruction in Poultry Husbandry is perhaps the strongest ever assembled. Every man connected with it has accomplished great work in the poultry industry. All are practical and successful poultrymen—most of them are experienced teachers—all are known and respected by the poultry fraternity—each one can and will help you.

Consider this list of real authorities in poultry husbandry—men to whom you can submit your problems—men who will guide you to success in this great industry: Mr. H. C. Forster, Mr. T. F. McGrew, Mr. F. L. Benedict, Mr. M. L. Chapman, Mr. John S. Martin, Prof. F. H. Stoneburn, Prof. F. C. Elford, Prof. A. E. Rolf, Prof. F. C. Hare, Prof. G. D. Horton, Dr. N. W. Sanborn, Prof. J. E. Dougherty.

Consider, too, the geographical location of these men. One of them lives near you—knows your LOCAL conditions—can give you help on problems which peculiarly affect your section.

Each student receives the basic course which completely covers commercial poultry keeping and in addition a special chapter dealing with special conditions applying to the section in which the student lives, as Canada, the lower Mississippi Valley, the Southeastern States, the Pacific Coast, etc. This new feature is of greatest value.

The lessons are practical, interesting, understandable, workable, complete. And they are right up-to-date, including all the latest developments in the industry. They are prepared in loose leaf form and are lavishly illustrated, many cuts being in four colors.

This remarkable course is offered at a moderate price, a price made possibly only by the fact that the United Y. M. C. A. Schools are operated primarily for service and not for profit. No matter who you are or where you are, you may secure its benefits. It will pay you to investigate now. Write today for full particulars. Just say, "Tell me about your home study course in Poultry Husbandry"—and we will tell you. Address

estimated that the total offspring from a single pair would reach the enormous total of 125,000 in about eight weeks. This rapid increase adds to the difficulty of controlling them. Since this parasite feeds on the body of the bird, the method of control is to treat the bird itself.

There are three treatments available, as follows: sodium fluoride, dusting with powder, and the mercurial ointment. The sodium fluoride can be purchased from a drug store, and there are two methods of using it, the pinch method and the dip method. In the pinch method the powder is dusted around the vent, feathers and wings of the bird, putting about a pinch in each place. In the dip method one ounce of sodium fluoride is added to a gallon of water and the bird is treated by dipping. This is more disagreeable than with the pinch method, but is satisfactory if done right. Dipping should only be done on a warm day. With the second method, that of dusting with powder, the powder is made at home at a very small cost, and is very effective. The following formula is used, three parts of gasoline, one part of any standard stock dip, and enough cement or plaster of paris to dry up the mixture. After mixing, place on a box to dry. The gasoline is used to prevent the cement or plaster of paris from setting, and will evaporate when the mixture is drying.

When dry, the mixture will be in a powdered form and ready for use. The mercurial ointment used in the third method is in the form of a salve composed of two parts of vaseline, and one part of blue ointment. This can be put up by any druggist. When applying this treatment, use a piece about the size of a pea, and place one around the vent, and one under each wing. These should be well rubbed in. When treating hens for lice, it is necessary to give two treatments in order to get the brood that was in the egg stage when the first treatment was given.

This type does a great deal of damage to young chicks. It is dark in color and about one-tenth of an inch in length. They live on the feathers of the neck and head, and the eggs are laid and glued to the feathers of these parts. They hatch in about five days and the louse is mature in about ten days. Treatment consist of using an ointment made up of a teaspoonful of any standard stock dip to a cup of melted vaseline or lard. Use after cooling. Pure lard alone is an effective treatment.

These differ from lice in that they live in the house and not on the bird. And on this difference is based the method of treatment. They are found in cracks, crevices, litter, nests, under the roosts, and other cracks of the house. Generally they are found in the cracks near the birds. The mite is long lived, and like the louse, it reproduces rapidly. They are red in color when full of blood, but normally are white to greyish white. This parasite has a sucking mouth part and lives on the blood of the fowl. The common body mite is from one-twentieth to one one-hundredth and twenty-fifth of an inch in length. During the day they remain hidden in the cracks and crevices but at night will come out and attack the bird. The eggs are laid in the cracks and crevices and other places the mite

UNITED Y. M. C. A. SCHOOLS

Dept. 15-A

375 Lexington Ave., New York

lives in, and hatch out in about four days. In from three to five days the mites are mature. During the winter they are inactive. It is necessary to spray two times in the summer, the second spray within ten days of the first.

Thorough spraying is very important in effectively controlling this parasite. Early spring is the best time to spray, but it depends on weather conditions. Clean up all rubbish and any unnecessary material around the house, as all these things form hiding places for the mites are mature. During the winter is good policy to have all equipment removable. Provide light and ventilation. Paint or spray the roosts, walls, and dropping boards with a full strength solution of two parts crude oil, and one part stock dip. Lime sulphur at the rate of five gallons to forty gallons of water is also good. Other spray materials that may be used with satisfaction are crude carbolic acid, kerosene, and ordinary stock dip and water. If the latter is used, it should be made stronger than usual.

This is a very small mite, that lives on the fowl all the time. It burrows under the scales on the shanks of the chicken, causing lameness and irritation. Dipping the shanks in ordinary crude oil is a good treatment, but care must be taken not to get the oil on the feathers. The number of treatments necessary will depend on how bad the bird is affected.

This is another very small parasite, and it works at the base of the feather. It causes irritation and general restlessness among the birds. Treatment consists of using an ointment made up of one tablespoonful of ordinary stock dip to a cup of melted vaseline or lard. Apply when cool. H. W. Baldwin.

OUR COVER.

The male on our cover this month is the Single Comb White Leghorn cockerel that headed the first young pen at the Chicago Coliseum Show, December, 1920. By comparing this picture with the illustration in the Standard of Perfection, it will be found that this male is far in advance of the Standard male. He has a better comb, a fuller breast, greater length of body, more symmetrical tail and he is deeper from center to back across saddle to vent. He is also better balanced on his legs. The beginner can take this illustration on the cover as a model.

The length of this bird, as measured from front of breast bone to tail coverts, is an expression of progress. This rangier type is characteristic of the birds that are admired most by many of the best breeders.

Standard weights for White Leghorns are: cock, 5½ lbs.; hen, 4 lbs.; cockerel, 4½ lbs.; pullet, 3½ lbs. There is a strong sentiment in favor of increasing the weights of both hens and pullets one-half pound in the next Standard, which will be issued in 1923. Too many White Leghorn females are small, dish bodied birds, and they are not producers of cockerels such as headed the first young pen at Chicago.

The Leghorn is an economical consumer of feed, eating about 10 pounds per head less than the birds of heavy breeds. The females are non-sitters and lay white shelled eggs. The variety has proven most popular on commercial poultry farms where hens are kept solely for egg production. From the breeders' standpoint, the birds are elegant and respond quickly to intelligent handling and wise mating.

April is one of the most satisfactory months in which to hatch Leghorns. If hatched earlier the pullets are very apt to start laying in August and September, and go into a fall molt, during which they do not lay. April and early May are fine for Leghorn chicks.

At the Chicago National Show the A. P. A. diploma for the best male in the Mediterranean class was awarded to the 1st Blue Andalusian cockerel.

Still Time—but Get Busy!

Order your Newtown Brooder and raise those chicks

As a poultryman, you know the Newtown Colony Brooder — possibly have used it — at least have seen it in operation. So you *know* it is the brooder that "raises the most chicks, the best chicks, with least labor and at lowest cost."

That's the brooder for you. The one you can depend upon to *raise* the big broods you will hatch during the next few weeks. Now you want to know whether you can still secure a genuine Newtown Brooder. Yes, YOU CAN! Your machine is here—ready for the shipping tag. We will get it started your way *quick*—the same day your order reaches us.

So get busy—*now*. Get the sure-thing-chick-growing Newtown on your plant at the earliest possible moment — and be happy.

Select the type you prefer — coal-burning or oil-burning.

The coal-burner has been used for years with most satisfactory results.

The newer oil-burner does its work exactly as well as the coal-burner, but is preferred by those who cannot easily secure hard coal, or who would rather use oil. Has a dependable heater that maintains the temperature at all times; a burner that can be relied upon (no clogging or thickening of oil); an oil flow accurately controlled by wafer thermostat; no wick to bother with; a steady blue flame and no smoke. And it's economical, too. Admittedly the leading brooder of its type.

Write or wire for catalog—get busy.

Conkey's The Starting

Conkey's Buttermilk Starting Feed carries your little chicks safely through the critical first 8 weeks. It is an appetizing combination of pure, sweet grain and concentrated sanitary Buttermilk.

It prevents the big losses due to weakness and disease; it gives your chicks the quick snappy getaway that produces early broilers and layers. Lactic acid in buttermilk is an "intestinal broom." It helps to sweep away the germs which are usually the cause of White Diarrhea. Buttermilk itself has a relishing, tonic effect on poultry, especially when combined with clean, sweet, plump grains, as Conkey alone knows how.

Conkey's Made by THE ORIGINAL Process No Dried Buttermilk Ever Used

Conkey's is different—Conkey makes the *only, original Buttermilk Starting Feed*. Conkey never uses "dried-out" powdered buttermilk. By THE ORIGINAL process which is exclusively used by Conkey, wholesome buttermilk, with its tart appetizing taste, is thoroughly incorporated with the other ingredients. However, it's not the buttermilk, nor the grain alone—its THE ORIGINAL Conkey process of combining them that produces such wonderful results.

Low in Fibre—Just Right in Protein

For baby chicks, feed with a protein content in excess of 14 per cent is dangerous, as the delicate digestive system cannot assimilate it. Conkey's Buttermilk Starting Feed runs 12 per cent, the ideal average.

A fibre content of more than 5 per cent is very injurious to little chicks. Conkey's is scientifically correct, for it runs only 4 per cent fibre. The correct balance of food elements and the high quality of ingredients make Conkey's Buttermilk Starting Feed the cheapest baby chick food you can use.

Too much fibre injures. Too much protein overtaxes. Conkey's is low in fibre and just right in protein. Read the guaranteed analysis of Conkey's and compare it with others: Crude Protein 12%—Crude Fibre 4%—Crude Fat 3%—Nitrogen Free Extract 56%—Carbohydrates 60%.

Feed It For the First Eight Weeks

When the chicks are hatched, give them clean water with the chill taken off and fine grit, but no feed for 48 hours. Then feed Conkey's Buttermilk Starting Feed dry, often but sparingly for the first few feeds, so they will clean it up, gradually increasing, and continue for eight weeks, with occasionally a little green food. If you do this, you should lose very few chicks on account of sickness.

Conkey's Buttermilk Starting Feed is sold at dealers carrying poultry feeds and supplies. Many dealers sell from one ton to 30 tons a season. It comes in 2½-lb., 5-lb. and 10-lb. containers, and 25-lb. and 100-lb. bags. If your dealer can't supply you with Conkey's, write direct to us and we shall see that you are supplied.

FREE—Conkey's Poultry Book

Send your name for a free copy of 64-page Book on Feeding and Raising of Chicks, Culling of Hens, etc.

The G. E. Conkey Co. Poultry Feed Specialists 6531 Broadway, Cleveland, Ohio

Try This Fair Test

Take one-half your first hatch and feed them three weeks on Conkey's Buttermilk Starting Feed. Feed the remainder of the chicks on any other chick feed you please. Then compare the two groups and you will find the Conkey-fed chicks bigger, stronger, healthier and more active.

Buttermilk

Original Feed

Conkey is credited with one of the most progressive discoveries given to the poultry world in recent years. THE ORIGINAL Buttermilk Starting Feed, as the **first** commercial poultry feed containing Buttermilk, placed Conkey in the front rank of contributors to poultry progress, but Conkey's greatest gift is the invaluable lesson he has taught in demonstrating the need of three different feeds for the most economical feeding of poultry. Conkey makes one feed for starting the chicks, another for growing and developing, and still another for the egg-laying period.

Be Sure to Get Conkey's in Original Package

If it isn't in the original package, it may not be Conkey's. Don't be misled by the use of the word "buttermilk," which is being used to cover a multitude of sinful grains.

Birds, like human kind, thrive best on things they like best, provided those things are digestible and nutritious. That is why chicks grow so fast on Conkey's—it's temptingly palatable, highly nutritious—at same time easily digested.

Hatchery Assn. President Endorses Conkey's

Herbert H. Knapp, Shelby, Ohio, President of the International Baby Chick Association, writes:

"In our own plant we found Conkey's Buttermilk Starting Feed a life saver. Not a single case of White Diarrhea this season.

"Your chain of feeds was a happy thought. Three Buttermilk Mashers for Starting, Growing and Laying are complete and surely do bring results."

Please remember, a baby chick requires a special ration for the first six to eight weeks, just like a baby must have an infant's diet. For a developing, maturing bird, a heavier diet, too rich ordinarily for the delicate digestive organs of a baby chick, is necessary to develop sturdy bone and muscle. And, naturally, egg-production calls for a different ration. This simple, logical system of feeding which Conkey has presented to the poultry world since he first introduced THE ORIGINAL Buttermilk Starting Feed, has proven so successful that hundreds of imitators are springing up. These imitation buttermilk feeds, flooding the market today, are the strongest proof of the tremendous practical success and value of Conkey's ideas.

Prominent Poultrymen Use and Recommend It

U. R. Fishel, the well known breeder of White Plymouth Rocks at Fishelton Farms, Hope, Ind., writes: "Conkey's Buttermilk Starting Feed is the best feed for young chicks. I have found nothing to equal it in the forty years I have been in the business."

A. A. Carver, Specialty Breeder of Rhode Island Reds, Seville, Ohio, writes: "Have used Conkey's Buttermilk Starting Feed for years past with remarkable results. Before I used it I always had a large mortality of young chicks each spring. Thanks to your Feed, I have saved this great loss."

H. L. Holsinger, Manager of the Summit Poultry Farm, Ridgely, Md., writes: "We have found Conkey's Buttermilk Starting Feed unequalled by any other. Some of the other advertised feeds were tried along with it, but results from Conkey's were so much better that we feel there is no comparison. 2200 chicks, fed on your Feed, were raised to eight weeks old with the loss of only nine chicks. Can anything beat this?"

Conkey's Time-Tried and Proven Remedies

Conkey's Poultry Tonic is a Regulator, Laying Tonic, Molting Powder and Chick Conditioner, made with scientific care and used the world over. Contains no filler and no cayenne pepper. It keeps chickens hardy, thrifty and profitable.

Conkey's White Diarrhea Remedy destroys the germs that cause the trouble and allays the intestinal fever. It is a soluble tablet, given in the water. Keep a box in your Conkey Corner during the hatching season.

Conkey's Lice Powder is unequalled for ridding fowls of body lice. Very effective, yet harmless. Guaranteed to satisfy or money refunded.

Conkey's Nox-i-cide is the great poultry disinfectant and germ destroyer. It will prevent disease and save you trouble and loss. Use it constantly.

Conkey's Roup Remedy has been the standard remedy for Roup and Canker for 20 years. Keep it in the drinking water during fall, winter and early spring.

BRINGING BACK THE SPANISH.

By CLARENCE HEWES.

A generation ago the supremacy of the Black Spanish as a layer was unchallenged. It was by far the most prominent representative of the Mediterranean class, and many fanciers vied with one another for victory in the showroom.

The white face, novel and distinctive, fascinated the fanciers of the time; it seemed they could never emphasize it to their full satisfaction, and they developed it larger and larger until a large pendulous appendage became the indispensable condition of Spanish excellence. Other qualities might be largely ignored if only large faces were secured.

Fairness demands the admission that birds of excellent type, color and of a size superior to most present-day strains were sometimes seen, and under the circumstances their creators certainly deserved great credit. But this was the period to which we are wont to refer as the era of the real fancier—the fancier who thought it a reflection on the spirit of his sportsmanship to have it intimated that he was to any degree mercenary or too practical in his aims.

Since extreme over-development of face is abnormal, it was difficult to obtain large faced birds. A close selection that could brook no interference of other considerations was required. Large faces soon dominated and obscured other Spanish traits. No doubt the Spanish breed suffered, in some degree, from lessened intrinsic worth, but not, I am sure, as greatly as is commonly stated and believed.

First Impressions of the Breed.

I was deterred several years ago in taking up Spanish from the frequency of remarks made by persons that I thought out to know, that Spanish were not hardy, that their eggs hatched poorly, that the chicks were difficult to rear, and the adult fowls easily acquired all poultry ailments.

To be sure, those who told me these things were not Spanish breeders. They were speaking from hearsay, but they were judges and poultrymen of wide observation, evident sincerity, and impartiality; and they invariably prefaced their remarks with a tribute to the superiority of the Spanish as a layer. It did not occur to me to doubt these opinions; furthermore, they obtained abundant verification for me in the few specimens of Black Spanish that I saw, which were, for the most part, huckster-shown birds at the fall fairs and small occasional exhibits at winter shows.

Males, usually cocks, seemed always to predominate in these exhibits. Since large faces were the index of excellence, and these were always borne by cock birds in the greatest exaggeration, breeders seemed to specialize in their exhibits on these old males, presenting them as most freakish and therefore the best of their possessions.

These birds were invariably shown in poor condition; the heavy faces made them coop-tired. In an apparent attempt to support their heavy heads they drew their necks in, humped up their shoulders, and gave a fair imitation of the "Don't Worry" chromos made famous by the G. E. Conkey Co. I unconsciously accepted these exhibits as substantiation of the unfavorable com-

DAKOTA, ILL.

ments I had heard, and now with a retrospective of a few years, can see why I did so and can appreciate the better why others, who may be attracted to Spanish, may, under this combination of advice and observation, turn away, unless a fuller opportunity for investigation is offered.

Females, as I remember, conveyed no sinister impressions. They were trim, neat, sizable, and had faces that had attained, except in very aged hens, no disfiguring size or coarseness. My impressions of them were always favorable, and even an occasional cockerel won my admiration. It was those facially disfigured, "dopey" cock birds that discouraged me.

Spanish Prove to Be Hardy.

Characteristics of certain strains are sometimes as pronounced as those of varieties or even breeds. On the very day that one man discards a certain variety as worthless his neighbor may take it up and, to do so, may drop the very breed with which the first man is going to replace his discards. Blanket claims of virtue for any breed will meet with criticism from one who has had an untoward experience with inferior specimens of that breed. So I will make no general statement that the unfavorable advice and comment given me was unwarranted. There are Spanish and Spanish; I have not seen them all. But I do wish to state that when I made my initial outlay for Spanish, securing a lot of baby chicks, I found absolutely nothing in their habits of growth and development to justify any criticism of their health or vigor.

That lot of chicks was the foundation of the flock of Spanish I have today, and after some years of opportunity for closest observation, the Black Spanish has completely vindicated itself with me, by having proved absolutely healthy, vigorous and hardy, both as chicks and adults; and the birds have proved to be the best layers of any fowls I ever owned, and I have owned many. I have since bought from several different breeders and strains, and these purchases, for health, vigor, hardiness and active dispositions, have invariably been all that could be asked of any fowl.

In all my investments in Spanish I have expressly stipulated against large, overgrown faces, and it may be that in so doing I was specifying a hardy type. Perhaps, again, this matter of vigor, like other qualities, is a matter of strain as much as of breed. I do not know, as I say I have not seen them all, but I have met during the past season several breeders of Spanish who were just a bit resentful at the common tendency of lay poultrymen to criticize Spanish in too general terms.

It might be politic for one who wishes to encourage the breeding of Spanish, as I do, to ignore this matter of constitutional vigor, but the impression prevails in the mind of the poultry public that there is a question about the hardiness of the Spanish, and this suspicion can only be met by facing the facts.

Get Away From Abnormality.

The first step toward bringing back the Spanish is to abandon promptly and finally the idea that they can hold a reputation for economic worth while bred to an accepted ideal that fixes the development of an ungainly and abnormal head appendage as the gauge of superiority.

Extreme development of novel or dis-

BUSINESS BIRDS

IT is not eggs alone that yield profit to the poultry raiser.

Half the stock is roosters. Big broilers—massive, meaty roasts—giant capons—the all-round Business Birds bring results. Eggs plus meat means

The Magic Brooder

Self-regulating; efficient and high-grade throughout; built with top and bottom draft; gas-proof chamber (the only brooder with this improvement); rocker grate and improved regulator. Will brood strong, vigorous chicks. Reader, the success of raising poultry depends on the brooder. It must hold the fire and never go out. You only have to kill a chick once to be dead. Even one good chill will ruin them for life.

Buy the Magic—the most dependable brooder in the world; it insures success. The writer, C. V. Hill, gathered in December over 1,000 eggs per day from 2,300 layers raised with the Magic brooders, which net a clear profit of forty to fifty dollars per day. Come to Trenton and visit my Poultry Plant and see for yourself.

OUR GUARANTEE—Will refund money in 30 days if brooder does not do all we claim. Write for free catalogue, describing the Magic Brooder, together with plans of colony and laying houses. Live agents wanted in territory not taken. Address,

WHITE QUILL WHITE ROCK HATCHING EGGS ARE THE BEST

Mr. A. F. Poltl
Hartford, Wis.

Dear Sir:—Out of the setting of eggs bought of you from pen No. 6 last June, I got a hatch of nine chicks, but raised only four cockerels and one pullet. However, I am very well pleased with them. One of the cockerels and the pullet won first place and also sweepstakes over all other breeds as well as in their own class in the annual poultry show here.

I certainly appreciated the square deal I received from you and wish you unbounded success.

Yours very truly,
Wm. F. Lisanantti, 209 E. Birch St.

Hatching Eggs from my matings, made up of my recent Chicago Coliseum champions at the following prices:

\$12 per 15; \$23 per 30; \$38 per 50; \$70 per 100.

Order direct from this ad or write for free mating list.

Crystal Poultry Farms High Quality Baby Chicks

Baby Chicks and Eggs from heavy laying strains and prize winners at 1920 New York and Ohio state fairs. Thirty-nine leading breeds, also ducks.

Our customers tell us our chicks are the finest they have ever owned.

"Mr. Strong: I shall always recommend your place for baby chicks because one can always depend on yours as being just what you say they are."

"There are so many people who come to see our chickens which you sent us because they are the finest ones around here. They are the finest ones we have ever had and we have always kept poultry."

"The chicks which we got of you the latter part of April, started to lay the 10th of September and we have eaten so many eggs since that we are almost tired of them."

"The Langshan chicks which you sent me last year started to lay sooner than my Leghorns."

"We received the chicks last evening, all 100 alive and strong."

OUR PRICES ARE SURPRISINGLY LOW.

Demand for our chicks is tremendous and it is important that you order early.

Send today for our free circular and price list.

tinctive characteristics imposes an undue burden on practical qualities. Such development of any quality can only be obtained by subordinating, in the effort, every other quality. If success is gained, the result is a one-sided, freakish creature. To saddle onto a Standardbred fowl an abnormal development of one distinctive trait is to emphasize that trait to exaggeration and to render less prominent all others.

After several decades of observing Spanish bred to excessive size of face, it is not strange that the public has almost forgotten that this breed ever possessed other claims to distinction. In their minds, Spanish exist as an ultra-fancy breed, made novel and clownish by extreme development of a large, pendulous face. That Spanish have for centuries held renown as layers and as fowls of balanced and distinctive beauty is a fact that has been obscured by the giving of too much consideration and too much publicity to the fostering of a purely incidental characteristic.

Extremely large, overdeveloped faces on Spanish are unsightly and freakish. They create an impression of something abnormal and discourage a close acquaintance. They favor no end of beauty or utility, and can only be maintained by the neglect of more beautiful and more useful qualities.

This is not the tirade of a utility breeder. I am a fancier, but a practical one, I hope, breeding Black Spanish to every desirable end of beauty or utility, but refusing to follow fads and fancies that cannot lead to either end.

Desirable Changes in the Standard.

The white face must always remain a distinguishing characteristic of the Spanish. Sensibly and conservatively preserved, it should always be the trademark of pure Spanish blood. Pure white faces of medium size without a trace of foreign color, with the soft, fine texture of a kid glove, and lying smooth, without folds, ridges or excrescences, are not too easy to secure; in-

MINORCAS

America's Grand Champions at Madison Square Garden, 1920

National meet of the International S. C. B. M. Club, 1920.—We won: Cock, 1; Hens, 1-2-3-4-5; Cockerels, 2-5; Pullets, 3-5; Old Pen, 1; Young Pen, 2-3; Best Display; President's Cup. This is the Largest and Best Display of Minorcas cooped in the United States for many years—20 OF AMERICA'S MOST PROMINENT BREEDERS, EXHIBITING 204 BIRDS.

New York State Fair, Sept., 1920. We won: Cockerels, 1-2-4; Hens, 1-4; 4 Specials in Color and Shape. Only 6 birds shown.

Trenton State Championship Show, Dec., 1920. We won 5 firsts. (No old pen shown); Best Display; Specials. Best Minorca and Best Cockerel in the Mediterranean class.

Edgehill Minorcas in the hands of our customers have won the Blues at the largest and most prominent shows held during 1920.

Hatching Eggs from our choicest matings will produce Blue Ribbon Winners for you. Stock for sale; 1921 Mating List free.

Edgehill Farm, Box A, Scotch Plains, N.J.

deed, such faces, hanging like porcelain pendants below the coral red comb and edged in contrast to jet black plumage, give the Spanish the most striking and beautiful head appendages of any thoroughbred fowl. If there are any breeders with an ardent fancier's spirit who believe these qualities too easy of attainment, let them turn their attention to breeding out the ear-spot—a little task that alone will occupy their time and do no harm.

Considering the unanimity of opinion that prevails among Spanish breeders that their favorites have suffered from the long continued furtherance of large faces, there should be no difficulty in procuring from the Standard revision committee the recommendation for the removal of that line of text in the present Standard Spanish description which is the sole excuse of large-face advocates.

I refer to that clause in the descriptive text which, with reference to face, says: "The greater the extent of surface, the better."

The scale of points for Spanish is the same as for all Mediterraneans, and of itself never afforded justification for the encouragement of unduly large faces. The application of the same scale of points to Spanish as to other Mediterraneans was contemplated by the members of the former revision committee to act as a deterrent to the breeding of overlarge faces. But in placing no definite and specific allowance on the extent to which the face might be bred, they tempted judges to borrow from neighboring and kindred sections a valuation for face that they thought consistent with the emphasis given to it in the descriptive text, and thus, through indefiniteness, was defeated the very end sought.

I would recommend a scale of points for Spanish that places a definite valuation on face, and since lobes are in all respects a part of face in Spanish, I would suggest that instead of linking wattles and ear lobes together as one section, that wattles be allowed to stand

Keep the Chicks Growing

Fall Eggs Are Desirable and Profitable

Chicks hatched this month or later will thrive if fed wholesome food that is free from musty, hospital treated grains or ingredients.

When you buy of us you are not risking the life of your chicks, because every ounce of grain is ground in our own mill (70 tons a day) which makes it possible for you to obtain feed that is pure and sound.

Basic Feeds

can be had by any poultry feeder who is anxious to obtain only the very best in feed for chicks or more mature stock.

Pinhead or Steel Cut and Rolled Oats

Let us send one or both of these wholesome foods to feed to your growing chicks. There is no more wholesome food to be found anywhere than these two.

Send Your Formula Write and tell us what you are feeding and we will quote you prices that are governed by the quotations in the grain market, and when the prices go down you get the benefit. Could anything be fairer? Let us quote you on hulled or pinhead oats. We want you to know more about basic feeds as ground and sold by us. Let us send you our current price list; you can see what ground poultry meal is worth at mill prices.

Raise Every Single Chick

The best, safest, quickest and cheap-
est cure for bowel trouble and white
diarrhea among baby chicks is **preven-
tion**. These and other costly diseases
can be absolutely avoided by proper
feeding methods;—by looking well to
the sanitary conditions of houses and
grounds; by fresh air and pure water.
Poultry raisers should have plenty of
expert information on all these and
many other scientific phases of poul-
try husbandry. Don't waste time and
money trying out theories of your own.
Time was when the poultry raiser
could find out in no other way. But
experiments are no longer necessary.
All you have to do now is to take advan-
tage of what experts have proved through
years of effort. Advice is available from many
sources. One of the best general books ever
written on poultry is "Dollars and Sense in the
Poultry Business," by Prof. T. E. Quisenberry.
This new 96-page book, written in simple
language that the newest beginner can under-
stand, may be obtained free by any reader of
this paper who writes to Prof. T. E. Quisen-
berry, Dept. 2063, Kansas City, Mo.

999 QUESTIONS AND ANSWERS

124 pages. No matter what question
arises, this book gives the answer
in a few words. Questions for the
fancier about feeding, correct rearing
of chicks, what and how to build, dis-
eases, incubation, breeding turkeys,
ducks, geese, etc. Paper, 50¢; cloth, 75¢.
American Poultry Journal Pub. Co.
523 Plymouth Court, Chicago, Illinois

by themselves, and that face and ear
lobes be allowed to constitute a section
of their own to which a definite allow-
ance of points should be granted. The
pendulous portion of the face is com-
posed of lobe far more than of face, and
these two sections are included in speak-
ing of face, and should be combined in
one sections in the scale of points. In
a suggested scale of points for Spanish
I would suggest that the two sections
now reading as follows:

Head—Shape 2, color 4.....	6
Wattles and ear lobes—	
Shape 4, color 6.....	10
Total.....	16

be changed to read:

Head—Shape 2, color 2.....	4
Wattles—Shape 4.....	4
Face and ear lobes—	
Shape 3, color 3, texture 2.....	8
Total.....	16

I thus would take two points from
color of head and leave two, which are
ample for punishing the defects of
color found in this section when it is,
in fact, divorced from face. I would
take all six points for color from wat-
tles, which, when treated by themselves,
need a color allowance no more than
does comb, which gets along very well
without it, through the protection af-
forded by the privilege of cutting under
the head of "condition"—a provision
that is eminently wise and could as well
be extended to wattles.

It is true that wattles in Spanish are
subject to the possibilities of discounts
for degree of white extending from
face, but this can be punished as a de-
fect of face.

The entire six points now allotted to
color in wattles and ear lobes, with the
two points deducted from the allowance
of color in head, would go to our new
section of face and ear lobes, thus giving
us for the new section eight points di-
vided thus: three for shape, three for
color, and two for texture. This would
fix definitely the value of the new sec-
tion and each of its subdivisions. With
a straight-out, specific allowance of
value in the scale of points, and with
well defined limitations placed on size
of face in the text, there would no
longer be any incentive to breed for
large faces, and the Spanish would be
placed in a position where it could claim
its proper place as a practical fowl
without being obliged to "hide its face."

Minorca Type Not Wanted.

I would suggest no changes other
than the above in the scale of points,
and, in place of the clause recommended
to be stricken out in the text, would
favor the insertion of a wording limit-
ing the size of face as to length. I do
not think that the face should be per-
mitted to extend below the lower edge
of a normally developed wattle without
being penalized.

Since Standard changes are now in
the air, I would also say that I do not
think that the present Spanish illus-
trations "gee" very well with the Stand-
ard text as to top lines. I am unable
to observe any "short concave sweep to
tail" in the male illustration; neither
can I observe in the illustration of the
female a back "which rises in a short
concave sweep to tail." In the issue
thus raised between the text and the
illustrations, I favor the text, believing

Hatch by SOFT-HEAT for Bigger Profits

IN less than 4 months, Mrs. C. A. Saunders,
Center, Neb., made over \$120 with a small
Porter Soft-Heat Incubator and had 150 chicks
left. At present prices her return would equal
\$50.00 a month. Or, with the largest Porter,
\$75.00 or better. Hundreds of Soft-Heat users
tell of big profits. You, too, can make easy
money with a

Porter SOFT-HEAT Incubator

Hatches a big, strong chick from every good
egg by supplying life-giving moisture, as well as
warmth. Keeps shells brittle and membranes tender
so chicks break out easily—no suffocation, no cripples.

Tubeless—Automatic Cumbrous unsat-
isfactory tubes and

Sick Baby Chicks?

Germozone operates just as these people say.
It is preventive as well as curative, and
satisfaction is absolutely guaranteed. Twenty
years on the market. Sold by drug and seed
stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote:
"Two weeks after we started last spring we
were a mighty discouraged pair. Every day
from three to six chicks dead. A neighbor
put us next to Germozone and we are now
sure if we had had it at the start we
would not have lost a single chick." **Ralph
Wurst**, Erie, Pa.: "Not a case of white dia-
rrhea in three years." **C. O. Petrain**, Moline,
Ill.: "I never had a sick chick all last season." **Mrs. Wm.
Christiana**, Olive Ridge, N. Y.: "Have 800 chicks now 5
weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker
for chicks, chickens,
pigeons, cats, dogs, rabbits or other pet or
domestic stock—for roup, bowel trouble,
snuffles, gleet, canker, swelled head, sore
head, sores, wounds, loss of fur or feathers.

that we do not want quite the straight, severe top line of the Minorca.

The Spanish is a deep bodied bird and I would like to see the word "deep" in the text for body shape. Also, I think that Spanish and all Mediterranean breeds should be broader and better rounded across saddle, and this breadth should be in the frame and flesh and not merely in the feathers. Narrow sterns are not consistent in breeds laying claim to excellence as egg producers. A requirement for at least moderate width here would be beneficial, I am sure, not only to Spanish but also to Minorcas.

Spanish are a middle weight Mediterranean breed, and middle weight means just as much in this class as in the American class. Spanish, as judged by their Standard weights, are practi-

cally of the same size as Wyandottes and Reds. Truth compels the admission, however, that Wyandottes and Reds more often attain their weights than do Spanish. This has led some to suggest that Spanish weights are too high. I do not think so. The same attention that was formerly given to production of extreme faces can be as intelligently directed to improvement of size, type and color.

It is a vast tribute to the Spanish that throughout all its vicissitudes it has never lost its repute as a layer. The most untoward comments that I have heard were coupled with the invariable tribute to its prolific yield of fine, large white eggs, and yet today, when the need for these very qualities is greatest, Spanish are not realizing their pos-

sibilities. Their light has been hidden by their over-zealous advocates.

In type, Spanish are graceful and stylish; by disposition, they are active and singularly docile; economically, they are unsurpassed in their field. We have only to withdraw our support of extreme styles and to direct it to sane and sensible attainments, and Spanish will come back to popular favor.

There is somehow an association between beauty and utility. You see it in every one of God's creatures. A neatness; a trimness; a purpose of design, balance, proportion, symmetry; a touch here and there; a grace, a lilt, all to clothe Nature's necessary functions in forms of beauty and attractiveness. Fowls need not be uncouth to be useful; they need not be abnormal to be beautiful.

THE BUFFALO INCUBATOR

REPORT OF COMMITTEE OF FORTY OF THE AMERICAN POULTRY ASSOCIATION.

By T. E. Quisenberry.

The Committee of Forty which was appointed at the last meeting of the American Poultry Association held in Kansas City met for their third session in Buffalo, New York, Tuesday morning, March 15. Previous sessions having been held in New York on Nov. 4 and in Chicago on Dec. 4.

For the third time some of the members of the American Poultry Association who are vitally interested in the affairs of the association and in the promotion of the industry as a whole, have paid their own expenses across the continent to attend these committee meetings. Thirty-two members attended this last meeting in Buffalo, manifesting their genuine interest and fidelity in the constructive work which has been undertaken by this association.

The members present were as follows:
Chairman, Grant M. Curtis.....Quincy, Ill.
Secretary, T. E. Quisenberry.....

.....Kansas City, Mo.
G. L. Ratz.....Tavistock, Ont., Canada
A. F. Cooper.....Pittsburgh, Pa.
Thos. F. Rigg.....Iowa Falls, Iowa
Dr. O. B. Kent.....Ithaca, N. Y.
Prof. James E. Rice.....Ithaca, N. Y.
Frank L. Platt.....Chicago, Ill.
Lyle W. Funk.....Bloomington, Ill.
Franklane L. Sewell.....Niles, Mich.
E. B. Thompson.....Amenia, N. Y.
M. F. Delano.....Vineyard Haven, Mass.
Lester Tompkins.....Concord, Mass.
George Cugley.....Springfield, Ohio
Charles McClave.....New London, Ohio
Joseph Russell.....Toronto, Ont., Canada
Prof. H. R. Lewis.....New Brunswick, N. J.
R. O. Lipton.....Scotch Plains, N. J.
Chas. D. Cleveland.....Eatontown, N. J.
J. I. Lyle.....Plainfield, N. J.
Robert Essex.....Hamilton, Ont., Canada
J. W. Clark.....Cainesville, Ont., Canada
A. O. Schilling.....Buffalo, N. Y.
Harry Wolseiffer.....Vineland, N. J.
Harvey C. Wood.....Bound Brook, N. J.
Prof. Harry M. Lamon.....Washington, D. C.
James H. Barber.....San Francisco, Calif.
Geo. Urban, Jr.....Buffalo, N. Y.
Harry N. Clark.....Cleveland, Ohio
H. P. Schwab.....Rochester, N. Y.

Managing Secretary's Salary Guaranteed—
The committee felt that the success of the association, the effectiveness of our consti-

tution and the welfare of the entire industry in this country hinged upon the fact that a capable and efficient managing secretary must be employed to put into effect the work which had been undertaken and in getting our constitution to properly function. With this thought in mind they passed a resolution urging the president and directors of the association to employ at the earliest possible moment such a secretary. The committee signed a guarantee pledging the officers of the American Poultry Association that they would raise sufficient funds, if necessary, to guarantee the salary of such an officer; his compensation not to exceed \$6,000 for the first year.

Tariff on Eggs—Professor James E. Rice of Cornell University, chairman of the sub-committee on the defense of the poultry

DEATH OF H. V. CRAWFORD.

News reached the poultrymen in attendance at the Buffalo meeting of the death of Henry V. Crawford, for many years secretary of the Madison Square Garden Show. Mr. Crawford was in Florida with his daughter, Thos. F. Rigg had been fishing with him only two weeks before. He was 76 years old. His home was at Montclair, N. J.

industry, made a very complete report on the work which had been done at Washington with a view of trying to secure a tariff on eggs to prevent American poultry producers from having their product come in competition with the low-grade Chinese eggs which are beginning to flood our markets and which are having a damaging effect on same.

President Cooper of the American Poultry Association authorized Professor Rice to solicit the necessary funds to carry on his work in securing the adoption of a protective tariff. It was agreed insofar as Canada is concerned that we favor a basis of genuine reciprocity on poultry and poultry products and that no tariff be levied on poultry products for breeding purposes. The committee will ask for voluntary subscriptions from members and producers throughout the United States in order to carry on the work of this committee effectively as emergencies arise. This committee is also instructed to act in various other matters in defense of the poultry industry.

To Advertise Poultry Products—Professor H. R. Lewis of New Jersey was made chair-

man of a sub-committee on the promotion and development of the poultry industry with special regard to the standardization of poultry products and the advertisement of the food value of poultry and eggs, and this committee is to co-operate with the committee on the Defense of the Poultry Industry.

Constitutional Changes—It was thought best to permit the membership of the American Poultry Association to select the place of holding their annual meeting by their own mail ballot, the vote to be taken at the same time of the annual nomination and election.

Another change was suggested in the constitution, asking the association to increase the membership of the Standard Revision Committee for the revision of the present standard to nine members instead of five as permitted by the constitution at the present time.

Annual Dues from Members—The association is badly in need of finances to carry on its work and the president and officers of the association have been requested to send a special letter to all \$10 life-members of the association asking them to become contributing life-members to the extent of annual dues of \$2, until such time as the association's finances are in better condition.

Membership Campaign—It was voted to ask the board of directors of the association to prepare a suitable circular which should be well illustrated and strongly worded, setting forth the advantages of membership in the association and inviting non-members to join, and that various breeders, incubator companies, feed companies, poultry schools and others interested in the welfare of the association be invited to include these circulars in their letters and with their literature with the idea of putting on a general membership campaign.

Changes Affecting Breeds and Varieties—The committee have asked to have included in our Standard the date of admission of the various breeds and varieties as a matter of historical information.

The various sub-committees representing the different breeds in the Standard of Perfection were requested to make a general review of their description in the Standard and to make such recommendations to the revision committee as may appear to be advisable for the improvement and advancement of the breeds and varieties described and illustrated.

It was thought not to be in the best interest of the poultry industry to admit to the Standard subdivisions of varieties on the basis of differences in color or shades of color, and the committee voted to recom-

FIRST PRIZE OLD PEN BUFF ORPINGTONS CHICAGO COLISEUM SHOW 1920 BRED AND OWNED BY J. S. BYERS-HAZELRIGG-IND.

mend that any action, previously taken, which is in any way contrary to this be rescinded. [This refers to the Brown Leghorn situation. After long debate, the Committee of Forty voted against Light and Dark Brown Leghorns.—Editor.]

The Standard committee were asked to consider the advisability of making the Standard weights the same for all varieties of a breed. Some of the changes suggested were as follows:

Black Minorcas—It was recommended that the words "long legs" in the present Standard of Black Minorcas be changed to read "legs of medium length but not stily." Other specifications to remain the same as at present. The committee also asked to have considered the advisability of making the Standard weights of all Minorcas the same.

Orpingtons—A complete report of the description of the shape of a male and female was rendered by this committee. One of the main features mentioned in the report on Orpingtons was the fact that the committee recommended that not more than one-fourth of the shanks of the female should be hidden or covered from view by the feathers of the body and fluff, and not more than one-third of the shanks of the female should be hidden from view. This was done to make the bird appear a trifle higher on legs and to be a slightly closer feathered and better-producing specimen on the average. It was thought that the winning birds in Orpingtons at the present time correspond with the description as they recommended it.

Leghorns—The committee on Leghorns recommended no change in Leghorns except that the weights of the pullet and also the hen should be increased one-half pound in each case.

Anconas—A great difference of opinion exists regarding the making of changes in the Ancona Standard. The committee submitted changes which had been recommended by successful breeders and advised that the Standard committee give them due consideration. The weight of pullets was increased from 3½ to 4 pounds. Some asked to have every second feather tipped with white.

Wyandottes—Practically no change was recommended in Wyandottes, except that back and shank were to be described as of medium length rather than to read "moderately short" as in the present Standard.

Plymouth Rocks—Very little change was thought necessary in any variety of Plymouth Rocks. The committee recommended that the carriage of the tail of both male and female be lowered to 35 degrees by the profile method instead of 45 degrees as in the present Standard.

PIT GAMES

12 Varieties—Dead Game Stock—Good layers, fine eating. Beautiful and profitable. Stock and eggs. Catalog 2c.

F. C. WILBERT & CO., GRAND RAPIDS, MICH.

Light Brahmas—A number of changes were asked for by the Light Brahma breeders and in some respects the present show specimens of this variety are in advance of the Standard. The changes which they recommend will be presented to the convention and to the Standard committee for their consideration and adoption.

Rhode Island Reds—No changes were thought to be necessary in the present Standard for either Single Comb or Rose Comb Rhode Island Reds.

Speckled Sussex—It was thought best to slightly change the undercolor of all sections to be slate shading into white or red or both at the base.

Andalusians—A number of changes were recommended in both the color and shape of Andalusians which it was thought would greatly improve the breed. These changes will be called to the attention of the convention and Standard revision committee. [Standard weights to be increased one pound and male hackle, saddle and tail to call for more clear blue in ground color, with lacing.—Editor.]

Definitions—Some of the definitions in the glossary of technical terms were thought to be incorrect in some cases and not clearly understood in other cases, some important definitions being omitted entirely. It was voted to recommend revisions in some of these such as heel, pad, shank, leg, thigh, down, stubs, feather, slipped wing, split wing, etc. [Legs are to be divided into three sections, namely: Shank, leg and thigh. The word "leg" will mean the drumstick. This is not the thigh and it is an error to call it the thigh. The thigh of a chicken lies higher up, under the skin. The term "drumstick" is not dignified, and "leg," in common usage, means both shanks and drumstick. How to get the right word to cover the drumstick section is a hard problem.—Editor.]

Disqualifications—It was thought best to invite all specialty clubs to submit to the Standard revision committee a list of such disqualifications and serious defects in their respective breeds and varieties as they thought to be transmissible in breeding.

The disqualification for clean legged fowls are to include both down and stubs, appearing anywhere on the shanks.

If the superintendent of egg-laying contests and record of performance projects are forced to clip the wings of birds in order to confine them to certain quarters, same shall not disqualify such birds when they

are being judged for application for certificates of performance.

Where disqualifications occur because of legs and toes showing color foreign to the breed, fading due to egg production, shall not be considered a disqualification.

Any specimen having a great amount of red pigment on the sides or backs of shanks, same is not to be considered a defect or disqualification.

The Standard Revision Committee will be asked to define more clearly where the presence of feathers, stubs, down, feather formation, or holes showing evidence of same being removed, should appear in order to disqualify a bird.

Any featherlike growth such as down, stubs, or feathers that is found below the small round scales near the hockjoint is to disqualify.

Any twisted wing in which the primaries fold on the outside of the secondaries due to a deformity shall be a disqualification. Any bird with a pronouncedly split wing showing a bad gap between the primaries and secondaries is to be a disqualification unless such a gap is caused by missing feathers, or due to the immaturity of the feathers.

Standard Weights—A committee was appointed to investigate all the data available for the purpose of verifying all Standard weights and to recommend any changes they may find desirable for the best interests of the breeds and varieties affected.

The secretary of each specialty club is to be asked for an expression of his club on the requirements of his breed or variety for disqualifications for underweight, or as to the correct weight desired.

It was recommended that for birds whose Standard weights are five pounds or more, specimens shall be disqualified if more than 20 percent underweight, and birds whose Standard weights are less than five pounds shall be disqualified if more than 30 percent underweight. The disqualifying weights to be expressed definitely in pounds and fractions of pounds and to apply to all breeds and varieties, except bantams.

Determining Tail Carriage—It was thought best in designing the angle of tail carriage in the future, in all breeds and varieties where the tail of the fowl is so heavily feathered that the main tail feathers cannot be seen from the exterior, that the angle of the profile of the back and tail be used, instead of the angle of the second main tail feathers from the top as illustrated on page 37 of the Standard. This is not to apply to Leghorns and other such varieties.

Start Them RIGHT and Watch THEM GROW

These are not cows in stanchions, but husky Leghorn chicks feeding from two 20-inch Norwich Chick feeders. This shows hygienic chick feeding to perfection.

Cleanliness is of Vital importance in raising chicks. Untold thousands are sacrificed every season through unsanitary conditions. There is nothing that will spread disease quicker than polluted feed. If chicks can get into their feed they will pollute it, and the result is always sickness and loss.

The Norwich Chick Feeder keeps feed in and chicks out. The detachable guard rod prevents chicks getting into the feed, and is too small for them to stand on. All they can do is line up, as shown in cut, put their heads under the rod and eat.

The round feeder body prevents all waste. The feed saved will pay for the feeder in a single season, to say nothing of the chicks saved as a result of feeding under hygienic conditions.

The Norwich Chick Feeder is not the 25c kind that lasts but one season. It is built to conform to the high standard of all Norwich appliances, and with reasonable care will last a life time, making it the cheapest feeder on the market. Use it alike for feed, milk or water.

How to Feed Baby Chicks

You want your baby chicks to grow into strong, healthy fowls, as quickly as possible. Many amateurs try to accomplish this by overfeeding, especially when grain prices are low as at present. Such haphazard methods are fatal to success. Poultry raisers must learn to understand feeding. Learn how to feed at the right times of day, in the right way and in proper proportions. Don't experiment. It's costly and unnecessary. Get and use methods that experts have tried and proved successful. A good book to read is "Dollars and Sense in the Poultry Business" by T. E. Quisenberry, who has made a specialty of feeding problems for 25 years. You may have a free copy of this 96-page book by sending a postcard request to T. E. Quisenberry, Dept. 2662, Kansas City, Mo.

Faking—In an effort to protect judges and limit faking to the greatest possible extent a sub-committee was appointed to recommend certain changes in our Standard instructions to judges and in our show rules. Among the things which are considered illegitimate fitting and as a faking, are as follows:

The bending or breaking down of sickle and main tail feathers. Crimped or broken back saddle feathers. Artificial colorings of lobes, faces, beaks, shanks or plumage. Removing white from lobes or faces. Coloring or removing red from a white face or a lobe. Attempts to alter or cover-up disqualifications pulling feather formations from shanks or toes so that a hole or evidence of same is left. Processing or treating a white bird so that the skin is left irritated, the feathers brittle and the natural life and appearance of same destroyed. Dyeing or processing any colored or partly colored bird so as to deepen the tone of the plumage color or alter, soften, or intensify the shade and tone of the plumage color. Singeing or dyeing feathers. The use of any artificial coloring. Cutting, trimming, fixing, or mutilating the comb or any section of the bird. [It is planned to put these rules into effect during the coming show season so as to stop faking the color of Rhode Island Reds and stop other bad practices such as breaking down tails, etc.—Editor.]

All of the above are considered faking. To pull occasional undesirable feathers on any variety, except sickle, main tail preliminary and second feathers is not considered faking. [This refers to minor body feathers, such as occasional false feather in back, a zigzag barred feather, an old feather in a fresh feathered bird, etc.—Editor.]

Physical Changes in Fowls Due to Production—It was voted to add a new chapter to our present Standard, designed to show the changes which take place in any Standard-bred bird due to the development and activities of the productive function.

The present Standard of Perfection has given us our foundation, by and through which our modern breeds and varieties have been built. It has made possible the uniform development of breeds and varieties through the standardization of characters.

The present Standard describes the breed or variety in only one condition of development. That is the most perfect physical condition, which is the time when the bird is fully developed, in the bloom so to speak and is just coming into producing condition.

The purpose of this chapter is to describe and illustrate the physical changes which take place in the appearance of birds during varying stages of production and non-production.

A complete knowledge of these changes will distinctly serve the poultry industry in the following ways:

- (1) It will enable all classes of poultrymen to intelligently cull their birds to eliminate the low producer.
- (2) It will allow the breeder to select high producing individuals for use in his matings.
- (3) It will enable the breeder to correctly and intelligently select birds for production classes at poultry shows.
- (4) It will serve as a guide and instruction to judges in awarding premiums at such production classes at poultry shows.
- (5) It will serve as a text to students in studying culling methods and the behavior of birds in production and out of production.

A committee was appointed to prepare this chapter and same will be ready for submission to the convention at Seattle and to the Standard Revision Committee. The chapter is to be illustrated. Certain defects of shape in producing birds are to be illustrated and described in the Glossary of Technical Terms.

In order that all descriptions and phases of the present Standard birds be adequately protected and in cases where the present descriptions of shape in our Standard are not quite as full and complete as they should be in order to properly describe the productive qualities of our present Standard birds, it was thought best to ask the Standard Revision Committee to invite this special committee to sit with them in their final revision work so as to co-ordinate with each other and co-ordinate their work.

Subdivide or Breed Standards—The committee decided to recommend that the association, in addition to publishing our present complete Standard, also subdivide same and print and offer for sale separate breed standards containing the nomenclature, glossary of technical terms, instructions to judges, general disqualifications, cuts for defects and that portion of the Standard which pertains to that particular breed, together with its new chapter showing the physical changes which take place in a producing bird. The subdivided Standards to be printed upon receipt of sufficient orders to warrant same, and to be duplicates of the present Standard in illustrations, descriptions and general information as well as paper, printing and binding. The price to be not less than \$1.50 per copy.

SPECIAL OFFER

We want to

GIVE YOU A 100-lb. SACK OF THIS POULTRY FEED

For a limited time we are offering a 100-lb. sack FREE with every purchase of five sacks of Golden Grain Laying Mash. We want you to try this feed—to see what big returns you will find in from increased egg yield.

GOLDEN GRAIN LAYING MASH

will increase the yield of your hens three or four fold. It will make each hen produce 250 eggs a year where she now lays only 60 or 80.

Send your order now. You will receive your supply of Golden Grain Laying Mash in a few days. Within a week you will notice the increased yield from every hen.

The price is low—only \$2.75 for a 100-lb. sack, f. o. b. East St. Louis, Ill. You get six sacks for \$13.75, the price of five—ONE FOR NOTHING. It's an offer you can't afford to neglect.

GOLDEN GRAIN MILLING CO.

320 S. 17th St. East St. Louis, Ill.

It is a wonderful developer for baby chicks.

Remember, you get an extra sack FREE with every five sacks.

Send in your order today.

Kills Hatching

Many fanciers now use Egg-O-Latum, the great egg preserver, on all eggs for the market. It not only keeps them fresh, but prevents hatching, thus protecting against the pirates who watch to obtain high grade hatching stock at market prices. Rub on—wipe off—does not show. Eggs will never hatch, but keep fresh longer.

Egg-O-Latum is a soft, white, cerate wax, odorless, tasteless, harmless. Applied by simply coating palms of the hands, then rubbing on eggs: a dozen a minute. A 50c jar enough for 50 dozen eggs, \$1 jar for 200 dozen. If no dealer, order by card. Postman will collect. No extra charge. Handy as 'phoning.

OAK DALE FARMS

Announce

the purchase of Owen Farms' entire stock of **Single Comb White Leghorns**. This acquisition to our yards includes the famous First Prize White Leghorn Cock at the recent Madison Square Garden Show of which the American Poultry Journal said:

"First cock was one of the greatest cocks ever shown; good head, wonderful back and furnish of saddle; good station and grand sweep from throat around under breast and body; correct carriage, and splendid furnish of tail."

It means that Oak Dale Farms also secure the famous First Prize Cockerel at the great Madison Square Garden Show last year. Also First Prize Cockerel at the Madison Square Garden Show, 1919; the First Cockerel at Boston, 1918, and the Cockerel heading the First Young Pen, New York State Fair, 1919. These five males now head five of our choicest breeding yards, which were mated by Leghorn experts.

Aside from the few birds that we will reserve for breeding, we offer at special prices, the balance of the pure Owen Farms Stock in mated pairs, trios, pens and breeding yards; single cocks and cockerels.

This range flock contains all my carry-over sale birds and reserve breeders. Cockerels which I am holding for Cocks and Pullets and Hens for reserve and sale.

Wilbur Poultry Farm, Henry Wilbur, Prop. 104 Crandall Road, Tiverton, R. I.

One subdivision of the new Standard was to be a book on production values including egg and meat production, description and illustrations showing the changes which take place in a bird in and out of production, together with the best types and requirements for broilers, roasters, capons, etc., as well as a scorecard for judging eggs and dressed poultry.

Market Standard—A committee was appointed to create Standard rules and scorecard for judging market poultry and eggs at poultry and egg shows, at fairs and exhibitions of various kinds wherever such products are shown and this Standard and rules are to be incorporated in our Standard of Perfection.

There is also to be included a section or chapter dealing with instructions to judges, selected to place awards on eggs and market poultry shown in competition.

A committee was appointed to confer with the Bureau of Markets of the Federal government urging that a standard system of grading poultry and eggs be adopted and put into effect in this country, and to establish and enforce such standards, grades and classifications as seem most practical.

It was thought best not to issue a separate market and egg Standard except as mentioned above and it was the unanimous opinion of all present that nothing should be done in any way detract from the American Standard of Perfection or that would be detrimental to Standardbred poultry, and nothing should be recommended which could not and should not be included in our American Standard of Perfection.

Registration and Certification of Winnings—The committee voted to recommend the issuing of certificates to owners of winning birds made at poultry shows but did not approve of the national registration of fowls based on pedigree breeding. Inasmuch as the American record of performance council was already issuing certificate of performance for high egg production records that this association did not attempt to issue certificate of performance for it would only be duplicating that effort. It was moved that all birds entered in such projects should score not less than 75 points and be free from Standard disqualification. In certifying to winnings at all A. P. A. poultry shows the association is to agree to band and identify such winning birds and to charge a nominal fee for same. The local show association to receive one-third of the fee. A suitable

certificate will be issued to owners of all certified birds.

Poultry Shows—In consideration of valuable medals, diplomas and other prizes to be offered by this association at all official A. P. A. shows, the committee decided to recommend that each local poultry show association pay an annual license fee of from ten to one hundred dollars in proportion to the size of the show. Valuable service will be rendered each licensed poultry show by the American Poultry Association. Recommended that A. P. A. shows employ licensed judges.

Poultry show associations which offer American Poultry Association special prizes will be asked to emphasize on their entry blanks the list of these prizes together with the cost of membership in the association and the name and address of the secretary of the American Poultry Association.

Utility Classes—Production classes of Standardbred poultry, were recommended for all poultry shows and there will be provided in the Standard of Perfection a description of pullets and hens in heavy laying condition, as mentioned above, together with instructions to judges to be used as a guide in applying the Standard when judging all specimens in these standard production cases, and no bird in this class shall be eligible to a prize that scores less than the minimum points required by the present American Standard for that variety.

More Uniform Judging Urged—Some prominent members of the American Poultry Association appeared before the committee and urged that they recommend some method of securing more uniformity of decision on the part of the judges in making their awards. These members stated that when they made entries at poultry shows they had to study the whims of the judge more than they did the requirements of the Standard of Perfection. Some judges require one thing and some another. It was, therefore, thought best to request the Standard Revision Committee to work out some plan for schooling or instructing our judges so they might get together, exchange ideas and insure a more uniform application of the Standard in judging poultry shows.

The president and secretary of each active specialty club was invited to serve as a member of the subcommittee representing that particular variety and all such shall be added to the present subcommittee of this committee of 40.

Each member of this committee of forty and the subcommittee members and visitors present displayed a wide vision and a courage and fidelity such as we have never before seen displayed in the American Poultry Association, convention or in any of its committee meetings. The results of this committee work, we believe, will be epochmaking in the history of our association. Every member of the committee pledges the American Poultry Association its united support in carrying forward to completion the constructive work which has been undertaken.

GOING TO BUILD?

OUR new book on poultry house construction will be an invaluable help to you in building your poultry houses, yards, coops, hoppers, trapnests, oat sprouters, fireless brooders, exhibition and shipping coops and other equipment.

No matter what style house or what kind of equipment you want to build this splendid book will give you the information you need, including plans and specifications.

In addition to building plans of all kinds, this book contains practical information on every conceivable subject pertaining to poultry raising. Just glance over this partial list of contents:

The right soil for poultry yards.
Making the poultry house burglar proof.
Breaking up broody hens.
Caring for incubator eggs.
How to ship hatching eggs.
How to set a hen.

Hatching with incubators.
Caring for incubator chicks.
Feeding for quick growth.
How to fight lice and mites.
Cutting the cost of feed stuffs.

How to get plenty of eggs in winter.
How to pedigree and line breed.
How to cure scaly leg.
Home preservation of eggs.
How to provide green food and shade.

"BUILDING PLANS FOR POULTRYMEN" is a 128 page book containing 67 chapters of practical information.

PRICE ONLY 50 CENTS—Prepaid to any address. With an 18 months' subscription (new or renewal) to either the Rhode Island Red Journal or The Leghorn World for only \$1.00. A dollar bill is easy to send.

**Buy Parks' Strain Bred-to-Lay Barred Plymouth
Rocks (with the Eggs and the Fancy Combined)**

They are America's Oldest and Greatest Laying Strain. Now celebrating their THIRTY-SECOND ANNIVERSARY.

Yes that's a long time to be breeding for a purpose EGGS, but the Laying History of America shows that it has paid the Three Generations of Joe Parks, for Parks Strain have made and hold about all the World's Rock Laying Records.

Miss Wonder 148 eggs 148 days. Miss Graduate 313 eggs year, 203 eggs 210 days. Lady Martha 323 eggs year, 400 eggs 448 days. Miss Smarty 325 eggs 356 days, and a host of Contest Winnings.

Parks Rocks have simply layed their way into Universal Popularity. The demand for them is simply wonderful, that accounts for the great number of Parks Strain advertisements in the back of this and most every other poultry publication.

Where buyers get our strain direct from us and keep them pure we allow the privilege of advertising our strain and help them free gratis in any way possible. You'd be surprised the great volume of business Parks Strain advertisers are doing.

Can Supply Eggs or Chicks, but no more breeding stock until after May 20.

HOMESTEAD SILVER CAMPINES

THE VIGOROUS STRAIN

The FAMOUS BELGIAN FOWL.—For the fancier, there could not be a more BEAUTIFUL bird. Every breeder has come under its spell of fascination.

"SUPREMACY" is the DOMINATING feature of the HOMESTEAD SILVER CAMPINES, The Vigorous Strain, as bred in their purity at the HOMESTEAD CAMPINE FARM. Their records at MADISON SQUARE GARDEN—FOREMOST SHOW of the world—at Boston and N. Y. State Fair proves that HOMESTEAD dominates in the world of Campines.

Your first needs are eggs and meat—in this respect the Campines fill the bill better than any breed we know—they are wonderful layers and incomparable as broilers. The Campines are very light eaters, interesting and BEAUTIFUL.

Our matings are the best in the world and NOT AN EGG LEAVES THIS FARM WE WOULD NOT USE FOR OUR OWN PURPOSE—not a pen mated that we are not using the eggs for our own hatches, therefore we give you the benefit of our experience.

EGGS AS THEY RUN FROM OUR PENS—\$10.00 per setting of 15 eggs; \$17.50 for two settings; \$25.00 for three settings; \$50.00 for 100 eggs.

EGGS SELECTED FROM OUR BEST PENS—\$15.00 per setting; \$25.00 for two settings; \$45.00 for four settings and \$75.00 for 100 eggs.

NO BABY CHICKS FOR SALE. Our new circular, which contains considerable interesting information, will be sent on request.

HOMESTEAD CAMPINE FARM

Box A

Wayland, Massachusetts

SPECIAL REPORT BY JAMES E. RICE (Chairman of Sub-Committee on Defense of the Poultry Industry)

A large number of influential men in the sixty-sixth Congress apparently recognize the fact that agriculture should receive equal consideration with other forms of manufacture in the framing of new tariff laws. They need and they have good reason to expect our support. Likewise, there are many able men in Congress who are opposed to tariffs on farming products, although entirely agreeable to tariffs on articles which are produced in the industrial centers which they represent. These men should be met by wise, vigorous opposition on the part of producers of agricultural products.

If we are to secure proper protection to our industry so that it will thrive as the so-called manufacturing industries have thrived we must meet the issue by education and organization.

Notwithstanding the encouraging features in the situation, we must not deceive ourselves as to the size and seriousness of the job ahead of us or underestimate the size and power of our opponents.

Agriculture is confronted by powerful interests representing great aggregations of capital, organized and entrenched, whose utmost power will be exerted to prevent tariff legislation intended to protect the producers of farm products. Our opponents are of three principal groups. First, wealthy corporations and individuals who find it more profitable to purchase agricultural products in foreign countries to distribute in the United States than to purchase them here, and who in many instances have agencies or branches doing business under different names in the United States and in foreign countries where the cost of production and standards of living are decidedly inferior to our own. These companies or their members frequently own or have large investments in the water and rail transportation companies, as well as in the large storage warehouses, distrib-

MAHOOD'S Single Comb Reds

They Point the Way

They Point the Way

Twenty birds under blue ribbons in 1919 and 1920 at Chicago Coliseum, the world's greatest Red Show. First and second young pen, first old pen and best display among other winnings in 1920 is a part of the unparalleled record of Mahood's S. C. Reds during the nine successive years they have won at this show. Send for Mahood's beautifully illustrated free mating list, containing a description of Mahood's carefully and scientifically mated pens in which every bird possesses the blood of nine generations of Chicago Coliseum winners.

Eggs from mated pens \$6.50, \$10, \$15 and \$20 per 15.

Chicks from mated pens—\$1.00, \$1.60, \$2.50 and \$3.25 each.

EXPERT POULTRYMAN having severed my connection with a large eastern plant, am in position to talk business with anyone needing an all-round poultryman. Fancier and practical. Address D. American Poultry Journal.

uting agencies and retail establishments throughout the country.

The second source of opposition is from the large industrial centers where great manufacturing industries employ millions of persons. These industries which have thrived by virtue of a protective tariff which farmers have generously supported now in many instances oppose an adequate tariff on farm products, in the belief or fear that such duties would increase the price of materials which they buy and the cost of living to their employees.

The third line of opposition is on the part of consumers who are not producers of food products. The great consuming public quite naturally is alert and sensitive to any movement which is likely to affect the price of food. It is easily stampeded by a cry that "a tariff will increase retail prices," and is convinced with difficulty that the large importers and distributors in this country, who are also the principal exporters from some other countries, will absorb as profits the principal difference between the price abroad and the price here, and that the supplanting of our home produced products by foreign products is hampering American industry, thus affecting the prosperity and buying power of all our people.

Each of these three groups is well organized and ably represented in Washington and throughout the country. Unless they are met by equally powerful organizations and individuals representing agriculture, they will win. If they do win they will stifle American agriculture by reducing the farmer's meager profits, restricting his production through unfair competition with products produced by cheap labor. The industrial manufacturers will continue to prosper by a tariff law which protects the commodities which they sell while letting in free the products which they buy. Thus we see the alignment of opposing interests.

America can only prosper when tariffs are so levied that all American industries shall be properly safeguarded against unequal competition from abroad. If we would secure such laws we must put forth individual and organized effort to educate the public and Congress as to the justice of our cause. In order to win we must first be right, and, being right, we must fight. It will require both right and might to win.

We must also be united. We must be agreed as to what we are to stand for, that is, upon the fundamental principles which should guard our course of action.

The tariff brief was prepared primarily with a view to securing a permanent tariff which is now being framed by the ways and means committee of the House of Representatives. This bill will bear the name of Congressman Joseph W. Fordney of Michigan, chairman of the committee. Presumably this bill will be considered by the sixty-seventh Congress, which is to assemble April 11, 1921.

Every poultryman and friend of poultry culture should have a copy of this brief. The tariff brief contains twenty printed pages and deals with exports and imports of poultry and eggs, tariff duties, transportation rates, costs of production, etc., and will be mailed at cost. The poultrymen of California are distributing 6,000 copies. A copy of the brief can be secured by sending 5 cents in stamps to James E. Rice, professor of poultry husbandry, New York State College of Agriculture, Ithaca, N. Y.

S. C. WHITE LEGHORNS.

NORTHLAND WINTER EGG STRAIN. Tom Barron English Single Comb White Leghorns. Our beautifully illustrated catalog shows lifelike pictures of our high egg pedigree breeders. Our demonstration pens are headed by big, scrappy males, fairly bubbling over with vigor, mated to selected females of the long bodied, big, lopped comb type. Our pullet No. 81 in the merit test under supervision of our State Agricultural College has laid 91 eggs in eighteen consecutive weeks commencing November 1, averaging over five eggs per week. We furnish foundation stock for commercial poultry farms, demonstration farms, egg laying contests, etc. Hatching eggs and chicks, \$11 and \$25 per hundred. Be quick. Northland Farms, Dept. A, Grand Rapids, Mich. 4

WYCKOFF'S STRAIN (direct) Single Comb White Leghorns. Heavy layers; profit producers. 100 eggs, \$6.50; 360 eggs, \$20. F. Havig, Route 2A, Osage, Iowa. 3-5

*An Oak Dale bird will reproduce itself;
therefore reliability exists in its breeding*

Don't Stand Still!

The poultry raiser who neglects to improve his flock each year is standing still, and is failing to live up to his opportunity to breed better and more productive flocks.

The secret of success in poultry raising lies in breeding to high ideals, and making purchases that will help you to realize those ideals.

Bearing that thought in mind you should procure for yourself the selective breeding of generations, during which time the pedigree has been restricted to choice individuals.

Hatching Eggs

Listed in our wonderful book of matings are about 65 pens and each headed by a bird that has won a place as pen head by his performance as winner of prizes. Everyone of our matings will produce a real desirable show type, keeping in mind the egg qualities for which our Leghorns are noted.

OAK DALE FARMS, Box A, AUSTIN, MINN.

The Mark of Quality

*The blood of successful Leghorn flocks
traces back in a direct line to Oak Dale*

*When you buy from Oak Dale you procure
the selective breeding of twenty-one years*

Like Begets Like

We mate only superior birds to produce superior specimens and every bird is typical of the requirements of the Standard of Perfection.

We do not mate birds together simply because they have been prize-winners, but because every bird that has won prizes, also has to be a top-notch layer.

One of the things that has made Oak Dale Single Comb White Leghorns so much admired is their soft velvety coat of feathers.

Baby Chicks

from Oak Dale have long bodies and stocky legs. All are bred from stock that has won the majority of prizes at Madison Square Garden for over twenty years. These chicks will grow, thrive and develop into large profit producing specimens. Write today for our book of wonderful matings—it's free.

OAK DALE FARMS, Box A, AUSTIN, MINN.

White Leghorns of the world are bred*

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

Win at the Premier Show of All the World
Madison Square Garden
New York, January, 1921

The Greatest Record of All Time

First Prize Cock at Madison Square Garden, New York, 1919—The Sire of First Prize Cock of 1921

Every Prize and Ribbon Offered

Cocks	- - - -	1st, 2d, 3d, 4th, 5th
Cockerels	- - - -	1st, 2d, 3d, 4th, 5th
Hens	- - - -	1st, 2d, 3d, 4th, 5th
Pullets	- - - -	1st, 2d, 3d, 4th, 5th
Young Pens	- - -	1st, 2d, 3d, 4th, 5th
Old Pens	- - -	1st, 2d, 3d, 4th, 5th

30 Prizes Out of 30 Offered

Sweepstakes Championship Male and Female and Every Special Prize—every bird bred on my farm.

This amazing record is an exact duplicate of the Imperial "Ringlet" record of 1920 at Madison Square Garden.

These **100% Perfect Records** are the crowning achievement of the unexampled "Ringlet" Records at New York for **more than 30 victorious years.**

The competition at this show was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

Supreme at Madison Square Garden Is Supreme Everywhere **IMPERIAL "RINGLET" EGGS**

You want eggs to produce the Silver Cup and Blue Ribbon winners for next season's shows. No other Barred Rock eggs have ever produced the extreme high quality birds as my Imperial "Ringlets." Hundreds of old customers order eggs every year—these eggs have brought them rich rewards in Silver Cups and First Prizes, and proved the foundation for many a money-making business.

My Imperial "Ringlet" eggs will place you in position to win at next season's shows. You may raise a single chick worth hundreds of dollars—hundreds of my customers have done this. **MY MATINGS ARE UNEQUALED IN AMERICA.** No such magnificent color and barring can be found on any living birds—as layers they stand pre-eminent.

My Eggs Are the Best Money Can Buy—They Produce First Prize Birds

Mr. E. B. Thompson, Amenia, N. Y.

Dear Sir: Just to let you know how the chicks have come along that I hatched out of the eggs I got from you last year. I won 1st Cockerel, 1st Pullet, and the pullet was Champion Female of the show, about 1,400 entries, so I am quite proud of my Imperial "Ringlets." The judge said that E. B. Thompson could put 125 birds in every class in any show room and all the other Barred Rock breeders in America could not get in between 1 and 125.

Sarnia, Ont., Jan. 31, 1921.

Yours very truly,

THOS. H. ROBINSON.

Grand Exhibition and Breeding Birds for Sale of This Richest First Prize Sweepstakes New York Blood. Elegant Catalog Mailed Upon Request.

EGGS From the finest exhibition matings in the world—one setting \$20, two settings \$35, four settings \$60, 100 eggs \$90.

Their First Stroll

90% of Knoxville Fair Birds Raised The **FUL-O-PEP** Way

Think of it! 90% of all birds exhibited at Knoxville Fair were raised on Ful-O-Pep Feeds. This proves beyond a question of doubt that the successful poultry raisers of the country appreciate the value of Ful-O-Pep Feeds.

At the left are illustrations of prize winners exhibited by Capt. A. Gains and Mr. R. E. Gettys—birds that made sensational records at the show.

Of Mr. Gettys' First Prize Barred Plymouth Rock Cockerel, Judge Schwab said: "This is the feature bird of the show." Judge Schwab also classed Capt. Gains' First Prize Buff Orpington Pullet as "Best pullet in show."

Such are the results that follow the raising and feeding of poultry

The **FUL-O-PEP** Way

Whether raising them for show purposes or for commercial profit, Ful-O-Pep Feeds fed the Ful-O-Pep Way produces more eggs from laying hens and more pounds of poultry meat at less cost than any other feed.

Right now the Ful-O-Pep Way calls for the feeding of Ful-O-Pep Growing Mash from start to laying maturity with Ful-O-Pep Chick Feed for the grain part of the ration.

Write for Free Ful-O-Pep Poultry Calendar

This free book tells all about the Ful-O-Pep Way of raising and caring for poultry. Contains pages for keeping egg records—Market Poultry and Egg Standard—How to Grow Capons for Profit, etc., one of the most practical and valuable books ever published. It's free. Write for it today.

The Mark of Quality

Oak Dale Farms

ANNOUNCE

the purchase of Owen Farms' entire stock of Single Comb White Leghorns. This acquisition to our yards includes the famous First Prize White Leghorn Cock at the recent Madison Square Garden Show of which the American Poultry Journal said:

"First cock was one of the greatest cocks ever shown; good head, wonderful back and furnish of saddle; good station and grand sweep from throat around under breast and body; correct carriage, and splendid furnish of tail."

It means that Oak Dale Farms also secure the famous First Prize Cockerel at the great Madison Square Garden Show last year. Also First Prize Cockerel at the Madison Square Garden Show, 1919; the First Cockerel at Boston, 1918, and the Cockerel heading the First Young Pen, New York State Fair, 1919. These five males now head five of our choicest breeding yards, which were mated by Leghorn experts.

Aside from the few birds that we will reserve for breeding, we offer at special prices, the balance of the pure Owen Farms Stock in mated pairs, trios, pens and breeding yards; single cocks and cockerels.

For mating list write today to

Start, Grow and Mature Your Chicks

on guaranteed feeds that are ground the very same day they are shipped. It is impossible for feed handled in this manner to become contaminated by dust or dirt and being "pawed over" by others, such is the case when you purchase feed from an open bin or sack. Another thing, when you buy our feeds they are pure, wholesome and sound, and free from musty

hospital treated grains or other ingredients. It is possible for us to furnish you with as much feed as you care to order—we grind 70 tons a day in our own mill.

Basic Feeds

Buy pure, wholesome and sound feeds such as we mill for you and then watch the youngsters develop into profit producing specimens that will make money for you. But, remember, you must have guaranteed feeds.

Pinhead or Steel Cut and Rolled Oats

Let us send you one or both of these wholesome feeds to give to your growing chicks. There is no better food found anywhere than these two for chicks.

Send Your Formula Write and tell us what you are feeding and we will quote you prices that are governed by the quotations in the grain market, and when the prices go down you get the benefit. Could anything be fairer? Let us quote you on hulled or pinhead oats. We want you to know more about basic feeds as ground and sold by us. Let us send you our current price list; you can see what ground poultry meal is worth at mill prices.

BASIC FEEDS COMPANY, Box 325, LOCKPORT, ILL.

Pullets

Pullets

Pullets

May we suggest that you place your order now—before it is too late—for the eight to twelve weeks old pullets.

Our Single Comb White Leghorns are bred from consistent layers, and the start we give the chicks assures you of heavy fall and winter egg production. Two dozen extra eggs in October and November will more than pay the price of the eight-week-old pullets.

Evergreen Poultry Farm, Westtown, Chester County, Pa.

TRY THE NEW WAY TO KILL LICE

**NO DUSTING
NO DIPPING**

**NO PAINTING
HANG UP THE BOTTLE**

A hen worried to death with lice can't lay if she wants to, but she eats just the same. You might as well "throw money to the birds," as feed high priced food to lousy chickens. It's a dead loss—don't do it.

Licecil

Kills Lice

Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

READ THE EVIDENCE

IF YOU have never used Licecil and are inclined to doubt the claims made for it, just consider the letters which appear on this page. These testimonials are but a few of the hundreds that are continually coming in from satisfied customers from all parts of the U. S.

KEEPS ON USING LICECIL

Please find check for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.
J. D. ALLEN, Lynchburg, Va.

IT DOES THE WORK

I have used the three bottles of Licecil according to directions. It did the work all right.
OSCAR THOMPSON,
Long Beach, California.

WANTS MORE

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now.
JOHN HOLTRAP,
Lynden, Washington.

VERY EFFECTIVE

Received shipment of Licecil, which I have divided with some of my friends. We have found it very effective.
HANS EYERSEN, Silver Creek, N. J.

PLEASED WITH RESULTS

Received Licecil sometime ago and am well pleased with results. Expect to use it continually hereafter.
FRED S. WILLIS,
Wyandotte, Michigan.

LARGER ORDERS

Enclosed find \$5 for six bottles of Licecil. Kindly rush this along and oblige. One of your satisfied customers.
EDWARD LEHR, Escanaba, Michigan.

REORDERS

I enclose \$2.50 for which please send me Licecil. I found Licecil very much better than anything I ever tried.
MRS. JOHN ANDERSON, Buford, Wyo.

KEEPS ON USING IT

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.
J. E. PLATT, Maywood, Ill.

THE BEST

I bot a bottle of Licecil from you some time ago and found it the best thing of the kind I ever used. Please send me another bottle for the enclosed.
MRS. L. M. JOHNSON,
Plumville, Pennsylvania.

LITTLE WORRY OR WORK

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.
BERNARD F. OSTERFIELD, Dayton Ohio.

SEND MORE

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.
L. G. STAYNOS,
Sherman, Texas.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

HOW TO USE LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in a mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

MONEY BACK IF IT FAILS.

1 Bottle \$1.00; 3 Bottles \$2.50; 12 Bottles \$9.00—All Prepaid.

BYERS' ORPINGTONS

Read my April ad on page 444

Some one has said that real greatness lies in giving opportunity to others. In this business that means the delivery of quality represented instead of a substitute. That's my policy as thousands of Orpington fanciers throughout North America will tell you. Regardless of what you may pay you can never start right unless the seller really has the quality to deliver and assumes a helpful attitude toward you when filling your order.

EGGS---Half Price

Eggs shipped prepaid. Infertile eggs replaced free. Cockerels and pullets, 2 months old, bred only from my Champion Exhibition Matings, \$8 each, 10 or more \$7 each. Buy them now and win at your State or District Fair next fall.

Morris White Orpingtons

"The Proven Leaders"

The World loves a Winner—we have them.
Winners as Layers; Winners in the Show Room.

Egg-Laying Records in Official Contests

Here are sample egg records of actual blue ribbon "Proven Leader" winners, bred and raised on our farm, made in Official Contests:

PRINCESS PAT	303 EGGS PER YEAR
PAULINE	245 EGGS PER YEAR
PEGGY	241 EGGS PER YEAR
POLLY	226 EGGS PER YEAR
PANSY	216 EGGS PER YEAR

Triumphs of 1920-1921

The Morris "Proven Leaders" won nine First Prizes out of possible twelve this season at America's two premier shows as follows:

CHICAGO COLISEUM,
December 6, 1920.

Cocks	1-2-3-5
Cockerels	1-2-3-5
Hens	1-2-5
Pullets	1-2-4
Old Pens	1-3-4
Young Pens	1-2

Best Display and All Specials.

MADISON SQUARE GARDEN, NEW YORK,
January 20, 1921.

Cocks	1-2
Cockerels	5
Hens	4
Pullets	1-4
Old Pens	1
Young Pens	3

Shape Special and Color.
Special on 1st Cock.

Our strain of White Orpingtons is linebred on scientific lines, no hap-hazard breeding. That accounts for our breeding First Cockerel at Madison Square Garden in 1914, 1915, 1916, 1917, 1918, 1919, 1920, and being able to win Champion Pen at both Chicago Coliseum and The Garden this season, containing our famous hen PAULINE, egg record 245; also Hen No. 61, egg record 215, proving again that the highest exhibition quality stock can also be high egg producers if bred right.

3000 White Orpington Chicks for Delivery in May—Also Eggs for Hatching

We are prepared to make prompt shipment of both eggs and chicks, all of which we send prepaid, guaranteeing safe delivery. Be sure to write for our catalog and mating list.

Wyckoff's S. C. White Leghorns

AMERICA'S BUSINESS HEN

Acknowledged everywhere as the World's Greatest Laying Strain—unequaled in standard qualities. Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most profitable strain of poultry in America today. Place your orders at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that on recent investigation of 20 of the largest and most successful Leghorn egg farms in the United States, in every instance, it developed that the WYCKOFF LEGHORNS were their foundation. The most substantial proof of their exceptional quality.

EGGS FOR HATCHING

from the most carefully selected matings. Our breeding pens for 1921 are made up of the most carefully selected lot of stock in the country, barring none. Every egg furnished will be from a grand lot of special selected birds, representing our highest quality stock in every particular. For size, strength, vigor and laying qualities, together with the true Leghorn type, they are unequaled. Positively no second grade or immature birds mated, and no orders filled with eggs from "farmed-out" or other bought up junk. We are **BREEDERS**, not hucksters. Place your order for some of the eggs from this high grade stock, and get in line with the most profitable era ever known in the poultry business. Send for free catalog, giving prices and complete description of stock, together with testimonials from satisfied customers in all sections of the country. Address

FRANK E. HERING, Desk B., SOUTH BEND, IND

S. C. White Leghorns

of Tom Barron strain. The great big, long body, wide back, deep keel, large posterior and large, beautiful drooping combs. Nothing else bred on Bella Vista Poultry Farm, Kimmswick, Missouri. Raised on Free Range, early matured, and commence to lay at four and one-half months' old.

Official Egg Records show the way they are bred and cared for at Bella Vista Poultry Farm, Kimmswick, Missouri. We have 600 like these in our special breeding pens this season, not a cull among them. The business hen. The money maker. The mortgage lifter. The kind you should raise if you want eggs and lots of them. We have been at it ten years. Prominent poultrymen say they are the best and healthiest large flock of S. C. White Leghorns they have ever seen.

Hatching Eggs \$3.00 per 15, \$12.00 per 100. Day-Old-Chicks, 30 cents each in lots of 25 or over. Hens for breeders, two years old, \$3.00 each. March, 1920, hatched pullets, \$4.00 each. As good birds as you ever laid eyes on. Eggs from our pen of thirty trapnested hens, which were in the Egg Laying Contests the past year, 25 cents each. If you want to raise this kind, better order now, as we could not supply half the eggs and stock we got orders for last season. If interested, write for catalog.

BELLA VISTA POULTRY FARM,

Box A.,

KIMMSWICK, MO.

Bred for Egg Production Official Records Prove

At the Nebraska National Egg Laying Contest, Nov. 1, 1919, to Oct. 31, 1920, she laid 255 eggs in a pen with 249 other pullets. Our entry of nine birds (one of the ten having died after having laid one egg) was sixth pen out of 98 entries, 250 pullets in each pen. Our entry was first for October, 1920. Note—nine hens only against many entries of ten hens each. **LADY BELLA** laid 254 of those eggs from January 1st to October 31st. Many ribbons at Mountain Grove, Mo., Leavenworth, Kans., and Lincoln, Neb.

The Dawn of a New Era in the Poultry Industry

MORE than 20 years ago in the town of Quincy, Ill., a young man founded a business that was destined to have a far greater influence on the progress and development of the poultry industry than he realized. When he began the manufacture of poultry raising equipment his biggest assets were faith in his ideas and a firm determination to work them out successfully.

Only those most familiar with the history of the growing success of the H. M. Sheer Company, know of the days and years of untiring efforts, the sleepless nights that this inventor spent in designing and perfecting the equipment that has been such a big factor in the development of the poultry industry.

The crowning achievement of Mr. Sheer's recent success, was the invention of his Sol-Hot Wickless Blue Flame Oil Gas Heater, which is fast revolutionizing the method of heating incubators and colony brooders and has been aptly proclaimed, the "dawn of a new era in the poultry industry."

Sol-Hot Heaters quickly became popular because they put an end to the troubles, losses and disappointments that always result from the old fashioned, dangerous, unreliable and unsatisfactory wick lamps with their soot, gases and inefficiency.

Each succeeding year has found the popularity of Sol-Hot Heaters increasing by leaps and bounds. They were successful from the start because they were WICKLESS and constructed on a principle which vaporizes common kerosene and produces an odorless, intense blue flame, thus doing away with the common objections of wick

burners and coal burning stoves—everything being made of high class materials and with a view to absolute safety, economy of operation and convenience.

If you could visit the modern, complete manufacturing plant of H. M. Sheer Company today, you could not help being impressed with the success that has been attained by Mr. Sheer. It is a living testimonial of what can be accomplished by perseverance, hard work and a striving toward an ideal. In this modern up-to-date manufacturing plant practically every part that goes into the construction of Sol-Hot Equipment is manufactured from raw material. The valves, burners, screens, thermostats, etc., (the product of this inventor's brain) are manufactured right here under his personal supervision. Sol-Hot Equipment is not an "assembled product." Every part is designed, which accounts for their greater efficiency, uniformity and dependability.

For instance, the Sol-Hot Burners are made in five different sizes in addition to the Giant Burner for Colony Brooders, while practically all other manufacturers of brooders who buy their heaters, confine their line to one or two sizes.

We believe it will be interesting to our readers to call their attention to a few of the improvements and conveniences that are found only in Sol-Hot equipment. For example illustration No. 1 shows the Sol-Hot for incubators. The burner can be lowered and swung to one side without disturbing the position of the oil fount or changing the oil adjustment regulator. This improvement does away with the necessity of adjusting the regulator every time the lamp is handled—a convenience that every user of an incubator lamp will appreciate.

Illustration No. 2 shows the first oil heated Canopy Brooder ever made—the invention of Mr. Sheer and one that made possible the caring for and

raising of big hatches—something that could not be done before artificial methods of brooding came into use. Illustration No. 3 shows the new modern Sol-Hot Canopy Brooder—the brooder that has put all others in the background.

The All Metal Vaporizer shown in figure 4, while a very simple device, marks one of the biggest forward steps in wickless oil heating construction. It does away with the old troublesome, asbestos ring vaporizers, with its carbon and inefficiency. Every poultry raiser who has ever operated a wickless burner with an asbestos vaporizer does not need to be told how much trouble they are. While they are all right when new, they quickly become hard and coated with carbon—are hard to start—burn unevenly and often go out entirely. This new All Metal Vaporizer will not carbonize—never wears out—is absolutely dependable and burns evenly all the time. The U. S. Patent Office on March 29, 1921, recognizing the originality and merits of this device, issued to Mr. Sheer, patents on this vaporizer with five claims covering almost any conceivable construction of an All Metal Vaporizer.

While it would seem that the height of perfection had been reached in Sol-Hot construction, a recent interview with Mr. Sheer disclosed the fact that very soon he has some more good news for poultry raisers—other new improvements are being perfected. This announcement coming from H. M. Sheer is of utmost importance to poultry raisers and just at this time to all dealers in poultry equipment. **Dealers before making contracts on next seasons goods, will find it to their decided advantage to ask for a demonstration of the new Sol-Hot with latest improvements. These new improvements and new pre-war price inducements will be welcomed by all dealers.**

Poultry raisers who are planning new equipment next season will do well to write to H. M. Sheer Company, 26 Hampshire St., Quincy, Ill., and ask Mr. Sheer to put their name on his mailing list to receive his announcement of the 1921 improvements when ready for mailing.

Owen Farms

S. C. RHODE ISLAND REDS
and BUFF ORPINGTONS

Stand Pre-eminent

Their record as the foundation blood for other good flocks all over the World. Their show record in my hands or those of customers of Owen Farms at large and small shows all over this country and abroad. Their individual egg records in trap-nests and flock records as layers wherever they have gone. Their prepotency, stamina and vigor; and their ability to make good for their owners, have all been factors in establishing their supremacy.

The permanency of Owen Farms' business has been assured by the genuine values given, and the "Golden Rule" treatment accorded to every customer. This is the reason that many hundred orders come back each year from old customers, and why "Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism.

The 1921 Egg Trade

Has taken every good shelled egg produced that has not been set here on the Farms. Many thousands of Owen Farms chickens are growing or hatching all over the country. The average quality will be the finest ever produced. Hundreds of these youngsters will develop into winners for egg customers of Owen Farms. Hundreds more will be hatched between May 25th and July 15th. June is the month of roses and also the month to hatch Red and Buff pullets that will be in bloom and will win the large shows from Thanksgiving week on. My customers who are ordering for early May delivery are wise and will have pullets just ripe for hot competition and not gone by.

Those of you who have not already ordered for delivery after May 15th will be glad you did so if you order now and take advantage of the half price rate and hatch winning pullets during June.

I will hatch here until July 1st, or a little later, as I want pullets for January and February showing.

Half Price Egg Sale

Commences May 15th. Look up my mating list or my April advertisement. If you have not a copy of the list, it is yours for the asking.

Eggs from my finest matings after May 15th will be \$12.50, \$9.00, \$6.00 and \$3.00 for 15. Combined sittings of Group 2 and 3 will be \$7.50 for 15.

Group 3 eggs for \$30.00 for 100, and Group 4 eggs \$15.00 for 100 are wonderful value for a small sum.

Half Price Stock Sale

Will give you fine tested breeding birds for just half their value now. You can carry them over for 1922 breeding or showing. At no other time of year will your money go quite so far in securing choice birds at a low cost. Write me your exact wants, and, if you will, the amount you wish to invest; I will write you fully and advise you to the best of my ability. See how close we can get together through correspondence. Come and visit Owen Farms if you can. If this is not possible, come to me by mail.

Improvement Begins in the Breeding Yard

Two Chicks Are Hatched—Both Are Bright Eyed, Downy, Chirping, Little Fellows—One Develops Poor Quality—The Other Becomes a Proud Showroom Winner—The Difference Is Due to Their Breeding.

By E. H. Hoffman

IN THIS age of progress and advancement every effort is being made for improvement in all lines of breeding. The Standard varieties of poultry are being so much improved through careful selection and wise matings that birds are now being exhibited that come very near the ideal. Ill shaped and poorly colored specimens are not as numerous as they were years ago, and in many of the varieties it takes a specimen that is almost perfect to win the blue ribbon.

This has been done through study, trapnesting and careful mating. Breeders are getting over the idea that they can get to the front by chance matings. They are constantly striving to mate their birds so the offspring will be a little better than the ancestors.

To do this requires study, and one must develop a real fancier's instinct to accomplish it. So many men and women are developing themselves into good breeders that the haphazard breeder is being outdistanced and his birds are remaining about where they were, i. e., in a rut. He does not seem to have the ambition to advance or to be able to make the keen analysis of mating which is necessary if he is to get to the front. And yet there are men in this progressive age who seem to be satisfied with showing second grade stock and meeting defeat in the showroom.

Such a man cannot be called a "fancier"; he is nothing more than a poultry raiser. Occasionally he may succeed in getting a few good birds, but when he does it is not through his science as a breeder, but merely because he happened to strike it right.

Flock matings are what are usually used by poultry raisers of this kind. They have twenty or more females running together and either allow a couple of males in the yard together, if they do not fight, or, if they do, they are alternated every day or two. Promoting poultry in such a manner cannot be called breeding. No pedigree record of any chick that comes from such a mating is possible; and there is absolutely no chance of building up a flock where such methods are used. If six or eight of the very best females were taken from a flock mating, carefully mated to a male that is suited to them, then improvement is possible; or if no improvement results from such a mating, the chicks that are grown at least afford a basis for observation and study. Every

chick from such a mating can be recorded, and if trapnests are used, the dam of every chick is known. The old plan of indiscriminately taking chances is an uncertain way to build up a flock.

Introduce Good Blood.

Breeders who are not satisfied with their flocks and know wherein they are weak, should either purchase a few good birds, perhaps a male bird, or eggs for hatching, from some reliable breeder who has built up his flock by linebreeding and has blood in his strain that will reproduce either as good or better. It is the foundation stock that goes a long way toward success, but that does not necessarily mean that, should a setting of eggs be purchased from the best breeding yards or from some large and successful breeder, the customer will immediately be in the same class with the man from whom he bought the eggs. The foundation stock is simply the start, and if the blood lines are there it is up to the beginner to build up his flock himself. He cannot expect anyone else to do it for him. He must take enough interest and know enough about his breed to do his own mating. He cannot expect to become expert in his line if he depends upon someone to come to his yards and mate his birds for him each season. The young breeder must early learn to assume a deep sense of responsibility in connection with his matings.

In building up a flock it is important to select a male that is full of vigor, as nearly ideal in type as possible, and strong in sections where the flock is weak. To such a male mate females, as far as possible, that possess features that are needed to improve the flock.

For instance, if a breeder has had trouble in producing birds with good head points, then he must not use either males or females having these defects in a pronounced degree that he is trying to overcome. Sometimes a Leghorn breeder is having trouble with white cropping out in the faces of his cockerels and pullets. This defect is very serious

as it disqualifies the specimen, and when it is once bred into a flock it is difficult to overcome. Therefore, never use a male that shows the slightest indication of white in the face.

Sometimes there is a dispute as to what constitutes white in the face. I have met Leghorn breeders who argued that white

He who has not grown a brood of chicks or planted a garden has missed much.

SPRING WORK IN THE POULTRY YARD

May Is a Splendid Month for Chicks—A Grass Range Is Desirable for Both Young and Old Fowls—Plant Corn or Sunflower Seed to Provide Shade During Hot Summer Months—Breeding Stock Should Not Become Too Fat. *By C. A. Simmonds*

THIS is the season of looking forward. The chicks that are hatched and started at this season are the basis for the year's success. What are the chances for rightly building upon this base? Are coops and colony houses all in good repair, cleaned and disinfected? How about the range? Will you be able to raise your chicks on fresh ground this year? If not so fortunately situated, you should turn over the ground and get it seeded down as soon as possible.

Chicks Are the First Thought.

Every poultryman usually plans to hatch as many chicks as possible. In the northern states the April and May hatched chicks are the easiest grown and generally mature into the best specimens. Early June is almost as good, but the chicks that are hatched later require good care and freedom from annoyance and domineerance of the older chicks if they are to develop as rapidly as the earlier broods.

Broody hens are plentiful this month, and it pays big to set every one of them. The more chicks you hatch, the closer you can cull. But do not make the mistake of culling too late, as it is better to give a few chicks plenty of house room and range over fresh ground, and good feed, than to try to raise too many and crowd them on the roosts or range, or fail to supply the proper amount of food and care. If the breeding stock has had proper care through the winter months they should now be producing an abundance of big, meaty eggs which will give ninety percent hatches and big, bulky chicks that will grow like weeds.

If you have been feeding your breeders dry mash, remember that the fowls are getting green food and animal food as well on range or in their parks at this season, and therefore should not be expected to consume large quantities of mash.

Be careful to feed enough grain to keep the breeders in good condition without them getting overfat. If you use an automatic feeder for feeding scratch feed, you can regulate the supply of this grain and prevent the birds from getting too heavy, by closing the slide a little and making them work harder for their grain.

At this season it is a good plan to set the hens on the ground, using half-inch mesh for the bottom of the nests, to keep out rats and mice.

If you are using incubators for hatching, you will need to cool the eggs longer, now that the weather is warmer. Cool the eggs during the second week of incubation till the eggs feel only slightly warm, and the third week cool them until you cannot feel any warmth at all. Pay no attention to the number of minutes you leave them out of the incubator, but leave them out till they feel cool enough when held against the eye. The eggs must cool down and the contents contract in order to draw in fresh air.

When the egg warms up again, the expansion forces out some of the air, and then the air in the egg is changed.

When the eggs are not cooled, the chicks are literally smothered to death.

Care of the Old Fowls.

A poultry plant that is laid out with a view to giving all the stock free range during the summer should comprise four fields: one for the hens that are to be kept over for breeding the following season; another for young cockerels after separating them from the pullets; and the other two for starting the young chicks. One for the early chicks and the other for later broods. The pullets remaining in the fields where they were started until time to put them in their winter quarters.

Now, by plowing up a portion of each field every year it is very easy to figure out a rotation whereby the brood coops in which the chicks are started will always be on ground that is fresh and sweet.

The poultry manager who takes a position on a plant laid out on different lines has a more difficult problem. Often it is difficult to provide green range for all the fowls. It then becomes necessary to plan the system of feeding to suit conditions and so offset as far as possible the natural disadvantages of the farm.

There are two ways in which grain is easily sprouted in the soil at this season of the year. One way is to bury the soaked oats in a trench, covering with two or three inches of soil and laying a board over the top to keep the fowls from digging out the oats until they are

Shade and Shelter for Young Stock on the Range.

ready to be eaten, which will be from three to five days, depending upon the weather.

This system is best for grass fields or yards where the sprouted grain is wanted for a soft feed and to supplement the green stuff on the range when the weather is dry and the grass through growing. The other method is suited to yards not large enough to keep sodded, or where chicks eat grain in a cornfield or potato patch. Twice a week scatter the oats that has been soaked about thirty-six hours over the yard or space in the field to be used, and follow with a one-horse cultivator plow. This will cover the oats just planted and also those of the previous planting that are now well sprouted. Fowls of all ages enjoy nothing better than to scratch in the mellow soil for the tender sprouted grain, which is both a feed and conditioner, aiding the digestion of other feed.

The exercise that the fowls are induced to take in the open air is also very beneficial, especially for those that are confined in small yards. The commercial poultryman who has been forcing his hens for maximum egg production during the winter is apt to find they are beginning to get out of condition at this season.

Some hens have pale combs and others' combs begin to darken at the blade and the tips of points, and they mope around in a dull, lifeless manner. The latter is an indication of liver trouble, while pale combs show a general anemic condition or lack of blood.

GROWING CHICKS IN LIMITED QUARTERS

A Successful Back-Lot Poultryman's Experience—His Method of Hatching, Brooding and Feeding—What a Man With Limited Space and Limited Time Can Accomplish.

By Alfred B. Garner

LAST MONTH, under the title of "Handling the Back Yard Flock," the writer told of his method of keeping chickens to secure the maximum number of eggs with the least expense and with the expenditure of but half an hour of time each day. That was an article on back-lot poultry keeping after the chickens had been raised and had reached the egg-laying stage. This is to be an article on hatching and raising of chickens to the egg-laying stage. It is also a story of poultry raising from egg to pullet and cockerel-hood which is meant to apply solely and only to back-lotters with limited space and limited time.

Right at the start we may as well say that this article on rearing is based on the supposition that the reader has adopted our view that the Mediterranean breeds for back-lotters spell success, the Leghorns preferred. The Mediterraneans, as we all know, are not classed as a meat breed, and for that reason are looked upon by many as of no account excepting as egg machines. Prospective back-lotters can hardly be blamed for this view, when we consider that perhaps their experience has brought them in contact with only the ordinary Leghorn scrubs by the thousands along the roadside farms. The poor opinion of Leghorns has no doubt been increased by a view of the bantam-sized eggs laid by these same scrubs.

A full-bred Black Minorca, one of the Mediterranean breeds, may easily weigh as high as nine pounds. Of all chicken eggs, the Black Minorca egg is the largest. No chicken, regardless of breed or size, lays an egg larger than the Black Minorca. If the Black Minorca laid as many eggs as the Leghorn, I certainly would advise keeping that breed alone. There are poultrymen who will say that it does. I can only give my opinion.

Different strains of Leghorns, and full-bred strains, too, differ greatly in weight. The kind advised by many breeders of prominence weigh but three and a half to four pounds each. I keep heavier stock than that. They are big, upstanding, vigorous birds. The average hens weigh from five to five and a half pounds each. But remember, whether you pick the heavier or the lighter strain, if you adopt Leghorns you will never have a pen full of clucky hens on your hands all summer to eat their heads off. The Mediterraneans, in confinement, do sometimes get clucky, but it is the exception and not the rule, and it can easily be broken up in a day or two.

And the Leghorn egg. The egg of a full-bred Leghorn of the proper strain equals in size and weight the egg of any other breed of chicken, regardless of size or weight or breed, excepting only the Black Minorca.

Leghorns as a Commercial Egg Fowl.

Another reason I advocate the Leghorn for back-lotters. When you want to raise a Leghorn chicken to pullet laying age, the best time is to have the hatch occur the latter part of April or early May. With the heavy breeds, to bring them to laying age before the cold weather comes, and to bring them to that age without too much forcing, you must hatch either in March or very early in April. What difference does that make? you say—only a month's difference. Yes, only a month, is true, but the difference in season of that month means the difference between night and day as poultry raising goes. March, as we all know, is generally the month of cold, blustery winds, with early April usually a good second. The winter tang still lingers in the air and the sun has not as yet developed its full springtime heat. That means just that much more care and attention and expensive heating appliances for the peeps, or it means the death of the peeps or the stunting of their growth.

On the other hand, Leghorn time (late April or early May) usually sees milder weather. Old Sol is now getting in his licks in good shape; he's warming up the ground, stirring up the bugs and worms, and giving just that degree of warmth and sunshine so necessary for the proper growth and health of the newly hatched balls of fuzz. And all this means just that many more chances of success; just that much less care and attention needed; and just that many more chicks raised to full grown chickens—sturdy, healthy, thoroughly developed chickens filled with that vitality so necessary for success.

I never hatch even my earliest Leghorns before the middle of April. There is danger, if hatched earlier, that they will mature, lay, and start their first molt before winter begins. This will stop their egg-laying and is to be avoided.

As this story is to conform to my former story of the back-lotters and show how I can raise chickens, have eggs and success, and still do all the work in a very short time and at such times as will not interfere with my daily work at the office, I want to plead guilty to the fact that if my method is followed you will need the help of your wife or family a few minutes a day for the first two weeks of the chicks' life. I find the majority of women who live in cities have a wholesome distaste and fear of chickens except for the time of their peep-hood days—and this is the only time I need their help. My folks are among the number and I can count on their assistance only for the first few weeks while the peeps are but balls of down.

The Incubator.

As I have but a limited number of chickens, due to the limited space of a city back-lot, I use but small incubators. The older an egg grows, the poorer will be the hatch and the less sturdy the chicks. You can keep eggs in a medium cool cellar for ten days with perfect safety, but I believe in using the freshest eggs possible, and I therefore use the small size incubators—the 60 and 65 egg size.

I also use a Magic Egg Tester to test the eggs before putting them into the incubator. There are several makes of these testers on the market, no doubt all good. I have used but the one kind and am only writing about what I know from personal knowledge. This egg tester will not tell you if the egg is fertile, neither will it tell you the sex of the chick that will hatch. But it will tell you the relative density of the contents of the egg—that is, whether the combined white and the yolk in the egg is dense and full with plenty of food for the growing embryo, or whether the whites and yolks are fluid and watery and capable of furnishing but a weak and scant feed for the chick that is to be. This means either a good big hatch of big, healthy, robust chicks which have no need to crowd together to keep heat in their little bodies, or weak, undernourished peeps, few in number, many of which will turn out cripples and runts. This is a big step toward success.

The tester is nothing but a graduated aluminum tube with a spring to hold the egg in place. With the egg in place in the spring, you drop it into a jar of water, and the depth to which the egg sinks on the graduated scale shows the density of the contents—the more weight relative to size, the better the egg for hatching. This would seem at first glance to be but a weighing of the egg, but it is more. It is a weighing of the egg and showing the weight of same as compared to the size of the egg. **Quite a difference.**

After sorting out the strong eggs in this manner they

go into the incubator. The incubator has been started three or four days before this and so regulated that it has held to the 102-degree mark for the last two days without variation. This is the temperature at which I start the hatch. On the seventh day I increase the heat to 102½ degrees and on the fourteenth day to 103 degrees and keep it at that temperature to the end of the hatch.

I place the eggs in the incubator on a Friday evening, because as I do not work on Saturday I have a better chance of giving them the right start. If I had a position where Saturday work was necessary, I would start them Saturday night and have Sunday for the day of watchful care. I start them at night so I will not be tempted to monkey with the regulator if it does not show up at the 102-degree mark as soon as I think it should. Although I know I had the incubator regulated properly before setting the eggs, and although I know it takes quite a few hours before the eggs will heat up and the thermometer show up the actual conditions in the incubator, and although I know if left alone that it will come back to where it was in due time, and although I know I should not touch it at all, yet I am always tempted to do something I know I should not—and if I am in bed I do not. Kind of a weak will power, you say; but they also say an honest confession is good for the soul.

I have the incubators in my cellar. The temperature there seldom varies to a very great extent. Around the incubators, on the cement floor, I splash water every day to furnish the moisture. I turn the eggs, trim the lamp every day, adjust the flame—all as the manufacturer directs. I see to it that the air is as pure as I can get it,* for I know without pure air the hatch will be a failure. If my steam heat plant is still going, I take especial pains to see that plenty of air is circulating to carry off the coal gas. Quite often at Leghorn hatching time the fire is out. Then the work of furnishing pure air is greatly lessened. Purer air—larger and better hatches are a certainty.

Getting Ready for the Chicks.

While the hatching is going on I begin to get ready for the chicks. I knock together a stand out of old boxes just high enough to comfortably tend to the peeps. The stand is about eighteen inches wide and four or five feet long. Around the top of this I place a thin board or heavy pasteboard top a foot high. This prevents the chicks from scratching the feed over the kitchen. Surmounting this is a wire netting about a foot high. This keeps the chicks in. A 2-inch strip divides the stand into two parts after allowing for the space occupied by the brooder itself. The front half is covered with about two inches of dirt and the other end with fine cut alfalfa or clover, and the soap box brooder.

To prepare the heatless brooder I use an Ivory soap box. This is the home of the peeps for the first two or three weeks of their existence. First remove the top. In the center of both ends and sides I nail a lath from top to bottom. Crossways on each of these strips I nail other short pieces of lath about an inch apart, having these spaces on sides and ends the same distance from the top. These form the notches wherein will rest the wire frame supports of the muslin covering that rests lightly on the chicks' backs. I round off each corner about three inches high with cardboard so the box has no sharp corners in which the chicks can congregate. This makes a kind of a circular instead of rectangular inside of the box.

Next we take a piece of springy strong wire long enough to go entirely around the box and with a loop on one end. Over this is sewed a piece of soft muslin or canton flannel. This is the piece of muslin which rests on the chicks' backs and gives them that sense of security given by a mother hen. One end of the wire is slipped through the loop end so it will slide and the wire frame fitted into the lath slots so the muslin, which must sag in the middle, is tightly drawn and is just high enough to rest lightly on the chicks' backs. As they grow older and

bigger the wire frame is moved to a higher slot to conform to the new height of the chicks.

Then comes the heater portion of the brooder, or, strictly speaking, the retainer of the heat the peeps themselves create, for this is the only heat either necessary or used in the brooder. To make this, make a muslin pad, well stuffed with cotton, but not too tightly, about an inch and a half or two inches thick, and have the pad just large enough to snugly and firmly fit the top of the box. Cut a hole in the front end of the box big enough for the chicks to get in and out. Over this opening fasten a slide which you can open or close, and in this slide have a hole about half an inch round. This hole provides air and circulation of air when the slide is closed. There you have your brooder, all for a few cents. The chicks themselves produce all the heat needed, and the cotton filled pad on top keeps it in and yet provides plenty of air circulation. This brooder will work with any number of chicks, not less than fifteen for the soap box size, and a larger number in proportion for a larger size brooder. It is a long explanation, but a very simple proposition when you make it.

Hatching Time.

If you have operated your incubator properly, the hatch will start early on the twentieth day. If you had it too hot, some will hatch earlier; if not hot enough, the hatch is delayed. Either too soon or too late means less perfect chicks and fewer of them. Let us suppose you have incubated properly and the chicks are popping out as they should.

I am going to tell you some of the "don't" items now. I plead guilty to not always carrying out this advice myself, and if you are like myself I know how hard it will be to persuade you to always carry out the instructions. For the few years I failed to carry out this advice myself I knew I was doing wrong but did it anyhow. I never do it any more, and neither should you. It means more chicks, better chicks, and success if you do not.

Watching Them Pop Out.—If you have children, it takes a hard heart to stop them from watching the hatching of the peeps. Even Father himself can hardly resist, and sits with his eyes glued to the glass door for hours. If the incubator is in a dark cellar he holds a light to the glass door, watching the operation.

Result.—As soon as the chicks are born they start for the light. They are still weak, moist and slimy. They flop and clamber over the eggs in their path, taking long rests on top of the eggs when their little strength plays out for a time, and leave a trail of slimy eggs in their journey, the slime cutting off just that much air from the unhatched eggs at a time when every bit of air is of vital importance. After a struggle, if there is a nursery space below, they reach the front of the incubator and drop down to the nursery. The nursery chamber is much cooler than the incubator, the chicks are wet and clammy; hence follows a chill. Or else, if the incubator has no nursery chamber for them to drop into, the slimy, clammy chicks crowd up against the glass, laying on top of all unhatched eggs in the front rows and making it almost impossible for them to hatch at all. Had you staid away and dropped a cloth over the glass door to shut out the light from the interior, the chicks would have remained right where they were hatched; would not have wasted their strength in a useless premature journey; would have dried off properly in the warm air of the incubator itself—and, no slimy eggs, no chilled chicks. Hence, don't.

Opening the Glass Door.—You see chicks seemingly gasping for breath; you see peeps half in the shell and half out that struggle and cannot get free; you cannot see the thermometer clearly, and you open the door to remedy it before the hatch is completed. And just as soon as you open that door, out goes the moisture so necessary to properly hatch the eggs; in goes the cold air to chill the eggs that are hatching and to chill the ones that are hatched and not yet dried off. And all of it unnecessary. A chick that

(Continued on page 617)

The Steady Position of the White Rock

A Variety Noted for Its Hatching, Growing and Laying Qualities—Breeding to Produce Exhibition Quality—If You Have Four Good Females Do Not Add Six "Fillers" to the Pen.

By Wm. A. Halbach

POSSIBLY no variety has been making more steady, consistent gains in popularity than has the White Plymouth Rock. Breeders and boosters of other varieties often ask: "Why is it that White Rocks have enjoyed an ever-increasing demand, without the usual dor-

A head of a high producing White Plymouth Rock female, showing strong vitality. To the right, the head of a low producer, showing the shrunken comb, long beak, overhanging eyelid and shallow face, all indications of low vitality.

mant periods? Why is it that anyone taking them up seldom, if ever, changes to another breed?" White Rocks have been helped by advertising and publicity, like many other breeds, but the birds themselves have measured up to the claims of their breeders, and the variety is today in the front row, with large classes in all large and small shows, with winners in egg-laying contests, with an unusual demand as superior market fowl.

Sifted down to a few words, the popularity of the White Plymouth Rocks is due to their sterling worth as money makers. In no other breed can one find such a happy combination of so many desirable features. A few fanciers breed just for the fun of it, but most people breed poultry for eggs, meat, profit, and in all three White Plymouth Rocks excel.

The Standard requirements for White Plymouth Rocks demand that the birds have a long body, combined with liberal width the entire length, as well as the development of the egg organs, which is necessary for egg productiveness. The raw material taken into their system is readily assimilated and transformed into the finished product, the delectable egg. The White Rock hen is not abnormal; she does not begin laying immaturesly; she is fully developed when she lays her first egg, and then gets busy on the job and diligently sticks to producing large brown eggs in paying quantities. That they have few equals and no superiors as layers is proved by their many winnings at the egg-laying contests.

White Plymouth Rocks are the ideal market fowl. Their thick, full breast, heavy thigh, fine firm meat, bright yellow skin, free from all dark and objectionable pin feathers, make them ideal for capons and always in demand as a table fowl at top prices. Only yesterday a farmer visited me and said, "I am going to start with White Rocks. My neighbor and I have been trying them out. I decided to keep the ——— variety, while my neighbor took up White Rocks. However, when it comes to selling them he usually gets from three to five cents a pound more than I do. Besides, his birds laid all winter long." Being great foragers and diligent workers,

the White Rocks develop unusual vigor and speedily attain a good size.

You will find that White Rocks do well in any climate. They are rugged and vigorous. They make good in large flocks on the farm, with unlimited range or in the confines of the back-lotter's small space. They are not inclined to excessive broodiness, but when set and allowed to rear their young they make good mothers. However, very little of their time is lost by hatching, but most of it is spent gathering material for tomorrow's egg.

It is safe to state that White Plymouth Rocks from one end of the country to the other are bred up to a higher degree of perfection than any other variety. This may seem like a rather strong statement, but the following facts are ample proof: The White Rocks are far in the lead when it comes to winning champion birds of the entire show. Old-time fanciers know that this award has been captured so often by White Rocks that they frequently ask, "Did the sweepstake championship go to a White Rock?" At the Chicago National Show, White Rocks have carried off the sweepstakes championship for best bird in the entire show three times in the last four years.

Utility and Beauty Combined.

However, the greatest factor in favor of the White Plymouth Rocks, the one feature that draws more converts to their cause than any other, is the combination of usefulness and beauty in the one fowl. Here the utility man and the fancier agree. The one can say, "She does lay"; the other cannot come back with, "She is an eyesore." Much has been written, more has been said about the fancy versus utility question. The average poultryman and most beginners were almost led to believe that an exhibition bird could not be a good layer—a good layer had to be a hard looker. But most of this sort of bunk has ceased.

Professor Phillips of Purdue University, a highly respected authority on poultry culture, in handling the winning hens and pullets in the White Rock class at the last Chicago National Show, made this statement: "These birds would look just as good in the utility class as they do in the exhibition class." The first prize hen in the Plymouth Rock bred-to-lay class and the first prize hen in the White Plymouth Rock exhibition class were full sisters. Facts of this kind prove the claim true that the Standardbred White

A White Plymouth Rock cock on farm range. Above, a White Plymouth Rock hen on the poultry farm of U. S. Dept. of Agriculture. Egg record: 84 eggs in 92 days; 109 eggs in 122 days; 176 eggs in one year.

Columbian Wyandottes Making Progress

Suggested Changes in the Standard that Will Make for Improvement—Back Color in the Male Highly Important—Undercolor of All Sections—Principal Defects in the Variety that Are Being Overcome.

By Ralph Woodward

THE time is approaching when consideration of the revision of the Standard of Perfection will be in order. In the matter of making past revisions, too little attention has been given to the advice and suggestions of specialty clubs, or else these clubs did not take sufficient interest in the revision to properly present what views they were agreed on tending toward the improvement of their varieties.

The Standard is intended to present in its phraseology, illustrations, definitions and descriptions of poultry something idealistic, something perfect; and the greatest care should be taken to make the descriptions of the various sections clear, accurate and harmonious one with another.

Advice and help should come from breeders who know their own variety and what its greatest needs are, and who wish "to make the beautiful more useful and the useful more beautiful."

The Columbian varieties, including the Light Brahmas, fared well in the last revision of the Standard, and the changes adopted have done much to improve both the breeding of exhibition specimens, and, by the clearer descriptions of some sections, have made it simpler for breeders, particularly amateurs, to understand the ideals to which they should aim.

The chief points of improved descriptions are found in a clearer statement of color of necks, both male and female; a better description of backs, especially in the backs and saddles of males; and, most important, a definite and concise term for undercolor, which was fixed as "bluish-slate" in place of the most indefinite and confusing "white, bluish-white or slate"—which meant nothing because it was not definite.

The adoption of "bluish-slate" for undercolor marks the turning point in the breeding of better Columbians, for it recognizes the need not only of a fair and concise name for a desired color, but also the importance of a deep tone of undercolor as a help to breeding. Another important point gained was in a disqualifying clause for speckled or blackish backs on females. If we believe in any disqualifications at all in our Standardbred poultry, a good start was made in disqualifying for black spots prevalent in the web of back feathers.

Probably it would have been asking too much at the time to have this same disqualification apply to the backs of males, as we were not educated then to clean-backed males; but now there is no question that, in the next revision, it should be made clear that it is just as important to have white-backed males as it is to have clean-backed females.

Back Color of the Columbian Male.

We cannot be too insistent on this obligation to have clean-backed males. The 1915 Standard gives a fair, accurate and clear description of the backs of both male and female. The disqualifications for females reads, "one or more solid black or brown feathers on the surface of back." The disqualifying clause then goes on as follows: "positive black spots prevalent in the web of the feathers of back except slight dark or black stripes in saddles near tail of males, etc."

This last part of the clause is supposed to apply to both sexes; but, as a matter of fact, is generally ignored in its application to males. Solid black striped feathers in the backs of males are surely as subject to disqualification as the corresponding feathers on the backs of females.

Feathers from a Columbian Wyandotte male. Feather to the right, from the breast, has a pure white surface and bluish-slate undercolor. The next feather is from the top of the back and shows the white surface necessary to meet the Standard requirement of a white back. Then comes a progressive group of four feathers that shows the ideal V-shaped black striping of the saddle. The stripe stops short of the lower tip end of the feather, and is completely edged around with white. The center of the feather is white, for if the stripe extended all the way to the slate undercolor, the male would produce pullets whose backs carried black feathers. This break in the stripe is a Standard requirement and an important breeding quality. Of course, a solid stripe in the hackle is desirable. Note how the undercolor of the breast (first feather to the right), matches the undercolor of the feathers from other sections.

Let us try to understand clearly what is intended in the Standard, which reads for a description of back on male: "Surface color, white; saddle, white, except feathers covering root and sides of tail, which should be white with a narrow V-shaped black stripe at end of each feather, tapering to a point near its lower extremity."

Mark you, this says, "Saddle WHITE with a NARROW strip at END of each feather." By what stretch of the imagination can this description be interpreted to allow us to consider as good birds those males with solid black striped feathers way down to undercolor (usually accompanied with a clear shaft of white through the center of these heavy black striped feathers on saddle, and part way forward on backs—sometimes nearly to the base of hackle).

The finding in our shows of these "dirty backed" males is not the fault of the Standard descriptions, but in the failure of its proper understanding. For this reason it is urged that the same disqualifications as given for females also apply to males. In short, leave out the words "of females" in the disqualifying clause.

We dwell on this matter at greater length than we intended, but it is important that the breeder understand what the Standard clearly calls for; and, besides, as a breeding proposition it is a fixed rule that if you breed from these males with heavy striped back and saddles, you will produce neither good clean-backed pullets nor clean-backed cockerels, either.

Correct Shade of Under-color.

Referring to under-color and the importance of deep under-color: we believe that in the present Standard a sort of "joker" is put over on the breeders of Columbian varieties. The undercolor of breast is given as "bluish-white" and all other sections call for "bluish-slate." Those of us who handle many Columbians and note the shade of undercolor have observed that the undercolor of breast is just as deep and strong a color as that which appears in the other sections, i.e., the undercolor of breast always matches the undercolor in all other sections.

It would be a mistake to leave "bluish-white" in the 1923 Standard. All sections of Columbians or Light Brahmas should have "bluish-slate" as the proper description of the undercolor of all white body sections, breast included.

Where Improvement Needs to Be Made.

The chief faults at present with Columbians are the following: White in the main tail feathers of both sexes; white in sickles of males; white in ear-lobes; off-colored eyes; lack of size and type; and "brassiness." Taking these in order:

We believe that if no specimen that had white in tail were used as a breeder that the fault of white in tail would be speedily overcome. This is radical, but our experience bears out that this fault can be overcome by most careful selection of birds placed in our breeding pens.

We object strongly to the Standard calling for the two top feathers on tails of females to be laced with white. It is hard enough to get good black tails, anyway, and these white-edged top feathers add nothing to the attractiveness of the female's appearance.

It has been suggested that a specimen having positive white in tail extending one-third or more over the length of any feather, be disqualified.

White in ear-lobes is a prevalent and unsightly fault. Why tolerate bad-colored ear-lobes? Never breed from any Wyandotte having white in ear-lobes, and soon you will fail to find bad ear-lobes in your yards, and this fault will vanish from the showroom. Is it any harder to have good ear-lobes on Wyandottes than on Plymouth Rocks? We suggest that the same disqualification that applies to Plymouth Rocks be applied to Wyandottes, namely, "positive enamel white in ear-lobes." This would help the Wyandottes. It would make it impossible to win on or sell a weak-lobed Wyandotte, and breeders would quit tolerating it.

Off-colored eyes may be cut in score-card judging, $\frac{1}{2}$ to $1\frac{1}{2}$ points. We would advocate a disqualification for "white" or "pearl" eyes, were it not for the fact that eye color fades out with age and old birds having bad eyes may have had good colored eyes in their youth. Never use young birds having bad colored eyes in your yards.

"Brassiness" is fast taking care of its own elimination, and we seldom see those "canary birds" in the showroom any more. This, like other faults mentioned above, can be eliminated. "Like begets like" is the rule to follow. Use good specimens and you will get good ones.

Feathers on the shanks and down between the toes are most embarrassing to the owner if they are found on his exhibition specimen when ready for the showroom.

The disqualifications for these on all clean-legged varieties should be abolished. The disqualifying clause only adds a premium to dishonesty. In other words, the careful or dishonest exhibitor pulls out these defects and maybe wins the prize: while the novice or careless exhibitor—not because he is more honest—allows them to stay in, and his specimen is disqualified and cannot win a prize. Do away with this farce.

Our idea of disqualifications might be stated as applying to any specimen that has a fault or blemish so serious that it is totally unfit thereby to be used as a breeder in a breeding yard.

This properly applies to crooked backs, deformed beaks, squirrel tails, specimens two pounds under weight, and those that fail absolutely to have the characteristics of the breed or variety under which they are shown.

Our Columbian Wyandottes, along with some other varieties, are frequently somewhat under weight, as shown and bred, and we need a stimulus to get and hold them up to Standard weight. We suggest that the disqualification be one pound in place of two pounds for under weight. Breeders ought to consider this as a step toward the elimination of specimens too small for exhibition—also too small to breed from.

Columbian varieties are growing more popular year by year, and we must see that the Standard revision helps to improve them and make them more attractive and more popular than ever.

Old time breeders of Light Brahmas have remarked:

J. W. Shaw: "I much prefer a male with clear, fine ticking in saddle, but not to go forward on back. A white saddle to tail lacks character, in my estimation, and I never breed from one of this kind."

H. N. Rollins: "I tell you it takes color to breed the necks, wings and tails we want nowadays. Give me a male with good solid undercolor and some striping in saddle for a breeder and show bird."

F. L. Sewell: "Without striping in this saddle section, the fine bold lacing and tail coverts well filled with black in female, are wellnigh impossible."

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

The Fate of the Standard

The Standard of Perfection is periodically revised. The first edition was published in 1874, the last one in 1915. A standing Committee on Standards, composed of three licensed poultry judges together with the president and secretary of the American Poultry Association, has charge of all matters relating to the recognition of new breeds and varieties and to corrections or proposed changes in the text and illustrations of the Standard.

According to the by-laws of the American Poultry Association, a general revision of the Standard shall take place once in eight years. This law automatically sets 1923 as the year when a new revised edition shall be published.

In anticipation of this general revision and publication of a new Standard, a special committee was appointed at the last annual meeting of the American Poultry Association, to "meet at some convenient central point within the next year, without expense to this organization, to consider and devise practical means for supporting and promoting the different important branches of market poultry and egg production along lines of adopting and publishing adequate satisfactory standards for breeding, judging and marketing domestic fowl and the products thereof, said committee to consist of the following named persons, which committee through its officers, is to report to this convention, to be held in August, 1921."

That is the text of the resolution which was adopted at Kansas City last August by the American Poultry Association, which brought into existence the Committee of Forty. There were probably as many different interpretations of the meaning of the resolution as there were men in the convention at Kansas City, but the resolution was adopted without debate, for the meeting of the committee was to incur no expense which would have to be met by the A. P. A., and it was taken for granted that this new committee could not seize the powers of the standing Committee on Standards, for the functions and duties of the Standard committee are outlined and safeguarded in detail in the constitution of the Association. There was, therefore, no objection raised to the creation of the new Committee of Forty.

After the A. P. A. convention adjourned, a preliminary meeting was called of those of the Forty who were present at Kansas City, that G. M. Curtis and T. E. Quisenberry who drew up the motion, might explain what it meant and outline just what the newly created Committee of Forty was to do.

It was plain to the members that the relation of utility qualities to Standardbred character was a fundamental consideration at this time, and that while the Standard makers in the past had endeavored to consider every known utility quality in connection with Standard types, many new theories were being advanced by the agricultural colleges and experiment stations which should be examined before a new Standard was published, that the Standard types of the practical breeds might be modeled along the most useful and productive lines. Purebred poultrymen are not antagonistic to sensible and practical Standards and they are ever striving to breed birds that give full expression to utility as well as beauty.

Acting in response to this open-mindedness on the part of the breeders, the Committee of Forty, at its preliminary meeting, set on foot a program which was to

"investigate and standardize the judging of poultry and poultry products for exhibition and market; to make the beautiful more useful and the useful more beautiful; to have the present Standard of Perfection take advantage of and include such knowledge and the result of such investigations and improvements as have been discovered by breeders, specialty clubs, state and governmental departments as the committee may deem wise and practical; to try to recommend Standards which will harmonize the views of the breeders of exhibition poultry and the producers of commercial poultry and eggs and at the same time preserve as far as possible the present Standard; to scrutinize and investigate the present type and standard weights with a view to increased production; to recommend for adoption for the popular Standard breeds and varieties, weights and types that are best for exhibition and commercial purposes; and to do and recommend anything which this committee feels will build up and strengthen the Standardbred poultry industry in either exhibition qualities, meat or egg production."

That is a broad classification of projects. The phrase in the last clause which reads: "to do and recommend anything," includes everything. Thus the entire Standard text was thrown open for analysis and certification; and it was

evident from the beginning that the committee's recommendations or changes would be awaited with concern.

The first regular meeting of the Committee of Forty was called in New York City, Nov. 4, 1920. Prior to this meeting, the secretary of the committee had a questionnaire printed, and copies were sent to hundreds, perhaps several thousand breeders, asking that they fill in the blank spaces with changes that they would recommend to be made in the breed and variety which they bred.

The constitution does not provide that the Standard shall be revised in this way. It does specifically state how the standing Standard Committee shall proceed to gather information by conferring with breeders, exhibitors and judges, how it shall give notice that its members will meet at a certain show to receive recommendations, and how assistance shall be rendered by affiliated specialty clubs.

If the project which brought the Committee of Forty into being, had functioned perfectly, the standing Committee on Standards would have probably become a sub-committee of the Committee of Forty, for the members of the Standard Committee are also named as members of the Committee of Forty. But, Theo. Hewes and E. C. Branch, important members of the Standard Committee, took the position that the intent and purpose of the Committee of Forty was to usurp their power. They declined to attend the meetings—and they had the basic law of the association on their side.

The Committee of Forty is thus put in the position of making its recommendations regarding changes in the present Standard text, to the Standard Committee. This situation operates to the disadvantage of the breeder who filled out and sent to the Committee of Forty a questionnaire on which he specified the changes that he desired in the present Standard text. The disadvantage lies in the fact that those changes first come before the Committee of Forty, where they are boiled down, and the Committee of Forty's recommendations then go to the Standard Committee, where they are sure to get further boiling.

If a breeder wants changes made in the Standard for his variety, he had better not run his recommendations through two sieves, for only the smaller particles will get through the double separation. It would be better for breeders to submit their entire program of alterations to the Standard Committee, which is the duly constituted committee to accept and act on proposed changes and thus dispense with the first sieve that is held out by the Committee of Forty.

Faced with this condition, the Committee of Forty has minimized the importance of its work along the lines of recommending detailed changes in the present Standards of the different breeds and varieties, and, shifting its ground, has proceeded to authorize the preparation of a new chapter for the Standard, with which the Standard Committee will have to harmonize all of its descriptions of shape and feather.

Thus did the utility men who were members of the Committee of Forty, side-step prolonged argument with the purebred breeders who were also on the committee. The utility men instead of laying their cards on the table and saying: "This is what we have and what we want you breeders to accept," came forward with the generous proposal of: "We will give you a new and valuable chapter for the Standard covering the important phase of production, and we will do this at no expense to the association." The bait was swallowed, bob, hook and sinker by the Committee of Forty at the Buffalo meeting, March, 15, 16 and 17.

This new chapter, which was voted to be included in the next Standard of Perfection, is to "describe and illustrate the physical changes taking place in fowls as a result of egg production." The chapter is divided into three parts and the skeleton outline of it covers two and one-half type-written pages. As an instance of how the Standard descriptions of the different breeds will have to be modified so that they will agree with this chapter, which is to be prepared by utility men, we quote the following subject which is to be discussed under the heading of plumage:

Influence of length, shape and fluff of feather upon maturity, condition of skin and fertility.

Investigators at Cornell University have found that White Leghorns that are short feathered mature earliest and are somewhat better utility birds. It is plain that the breeders of Standard Leghorns would not consent to shortening the feathering of their birds and breeding males with skimpy saddles and stub tails. So a new chapter is to be prepared and injected into the Standard, which will require that either the Standard text for White Leghorns be changed, or the utility chapter will stand in direct rebuttal to the Standard type.

Fanciers of the modern exhibition White Leghorns can quickly point out that the long-plumaged Japanese fowls are not slow to mature or poor producers; that length of feather is a matter of feed as well as breeding; that Cornell has not carried on its investigational work with Standard Leghorns and does not know the possibilities of this type; that the U. S. Department of Agriculture is producing a large number of 200-egg White Leghorn females whose brothers are of such splendid Standard type and feathering that they can win in hotly contested classes in large and important shows; and lastly, the shorter feathered Rose Comb White Leghorn is not enjoying equal popularity as a utility fowl, with the more elegantly finished Single Comb White Leghorn.

It would be a waste of time to try to refute such argument; but by preparing and injecting into the Standard an entirely new chapter on egg production, the Standard Committee is put in the position of either modifying its Standard text and descriptions, or permitting the utility chapter on production to stand in direct opposition to the Standard type and be authoritative evidence that the Standard requirements are erroneous, ephemeral and aesthetic.

The Committee of Forty accepted the outline for the chapter on production and authorized its preparation, and will recommend its inclusion in the Standard at the next meeting.

The factor of "length and shape of feather," is only one point out of sixty that are to be discussed in the chapter; yet, many breeds are affected by this one question of size of feather. All breeds of chickens have feathers, and not only is the typical shape of a breed largely dependent upon the breadth and length of the individual feathers, but the color designs of the plumage are also influenced by the size of the feathers. The secret of the Ancona female's color scheme is to get a long back feather that narrows to a point. Then the tip of white is small and neat and the long feather allows for a large ground of greenish black. Clothe the Ancona female with a short, round feather and you have a big white mottle and the ground color of the feather is so abridged that the bird appears very light in color. Do Ancona men want to breed a short feathered, heavily splashed bird in order to be consistent with the findings of a poultry investigator at Cornell, who has been working with plain-bred White Leghorns?

And what of the Silver Gray Dorking, that magnificent breed of which the chicks hatch with wing feathers? Their plumage grows rapidly and is long. Is the Dorking to be condemned in the Standard? We thought that the American Poultry Association was entrusted with a stewardship of all the breeds. In the past, Standard makers have been most careful not to let a phrase or a word enter the book that would prove prejudicial to any breed.

Are the breeds to be rated in the Standard? Thirteen new terms, defining the general defects antagonistic to egg producing type, are to be added to the glossary, if the recommendation of the Committee of Forty prevails. One of the thirteen defects is "pronounced pinch back." The artist who portrays this so-called defect need not look further for a model than the dressed carcass of a Cornish Indian game.

The Cornish breeders explain that the type a good Cornish should be of the shape of an egg, the largest end foremost and rather elevated with deep breast and prominent chest, the small end hindmost. No Cornish man ever claimed that his birds could win an egg-laying contest; but

he has claimed that he had a distinctive type and that his birds were very heavily meated. That the type has its admirers is attested by the fact that at the last Chicago Coliseum Show there were about 250 Cornish shown by breeders residing in sixteen different states and two Canadian provinces.

The Standard in the past has described and illustrated ideal Cornish type to guide breeders, and it has provided a basis for judging. Is the Standard to now differentiate between breeds on the basis of "production?" If the report of the Committee of Forty is approved, the Standard will cover more ground and discriminate between breeds.

Many other terms are "to be fully illustrated, defined and discussed for high, medium and low producers." These terms are to be used in Part I of the

chapter on Production. This part is headed: "The Reproductive Function of the Domestic Fowl." In it will be given a description of the reproductive organs and the development of the egg. In it the economic importance of egg production will be discussed.

The Standard is not the place for argument and discussion. It is a standard of ideal types for breeders and judges. The place to discuss the economic phases of production is in a book on poultry keeping, the poultry journals, the agricultural college bulletins, etc.

In Part I will also be described and illustrated "the reproductive organs of the young chick through one complete cycle of production and following dormance." Again, the Standard of Perfection is not a book on ovarian development. Commencing by illustrating the

vital organs of a baby chick and carrying the pictures and descriptive text through a complete cycle of growth and development is not essential or pertinent to the Standard text, neither is it connected with the fundamental uses of the Standard, nor does it bear upon or serve to support the purposes of the Standard.

In Part I are to be discussed the factors that influence ovarian activity, such as food, growth, sanitation and parasites. The questions of feeds and feeding, of the influence of housing and care which "sanitation" means, and of the effect of lice have no place in the Standard. As one member of the committee remarked at Buffalo: "I never expected to see cock roaches and bed bugs have a place in the Standard of Perfection."

Part II of the new chapter on Production, which is recommended by the Committee of Forty to appear in the new Standard, is equally novel and astonishing. In it the physiological problem of the disappearance and reappearance of yellow pigment in the shanks, is to be discussed from the varying angles of food, physical condition, depth of fat, production, etc. Factors influencing constitutional vigor and vitality are to be set forth. The boney frame work is to be described in relation to production. The relation of molt to production is to be reasoned out and explained.

The mere suggestion of inserting such topics in the Standard leads anyone who has used a Standard to wonder if the movers of such a resolution are familiar with the character of the Standard text. The Standard is a book of law, a book of rules established by the authority of the American Poultry Association, and such debatable questions as pigmentation and molt are not appropriate to its text. No discussion appears in the present Standard; only rules to govern appear in it.

The molt cannot be Standardized. Birds on grain molt early; those that receive an animal protein supplement may molt much later. The growth of skeleton is a matter of feeding as well as breeding. By increasing the amount of meat scrap and dry bone, a larger, coarser skeleton is produced.

Pigmentation is to some extent the result of environment. Birds on a clover run on farms do not fade the yellow out of their shanks as do those kept under intensive conditions. The yellow in the shanks and beak is due to xanthopyll, which is found in yellow corn and green grass. Perfectly normal White Leghorns have been produced at the Missouri Agricultural College that did not show a trace of yellow in beak or shanks, as a result of the birds having received no yellow corn or green grass. Xanthopyll also gives the deep yellow color to the yolk. Hens in the winter that are not receiving green food frequently lay eggs containing light colored yolks, just as the same hens fade their fellow shanks to white because they are unable to resupply the fat pigment xanthopyll. Now, if this fading is to be allowed, and shank and beak color are to no longer be considered important breed characters, then it follows that the scale of points must be changed, and instead of allowing four points for the color of beak and shanks in the Mediterranean breeds and five points in the American breeds, these sections will be passed by. When it comes to an important alteration of this kind, the issue should be decided by the purebred breeders, who made the breeds and

SUPREMACY

HOMESTEAD SILVER CAMPINES

THE VIGOROUS STRAIN

The FAMOUS BELGIAN FOWL.—For the fancier, there could not be a more BEAUTIFUL bird. Every breeder has come under its spell of fascination.

"SUPREMACY" is the DOMINATING feature of the HOMESTEAD SILVER CAMPINES, The Vigorous Strain, as bred in their purity at the HOMESTEAD CAMPINE FARM. Their records at MADISON SQUARE GARDEN—FOREMOST SHOW of the world—at Boston and N. Y. State Fair prove that HOMESTEAD dominates in the world of Campines.

Your first needs are eggs and meat—in this respect the Campines fill the bill better than any breed we know—they are wonderful layers and incomparable as broilers. The Campines are very light eaters, interesting and beautiful.

Our matings are the best in the world and NOT AN EGG LEAVES THIS FARM WE WOULD NOT USE FOR OUR OWN PURPOSE—not a pen mated that we are not using the eggs for our own hatches, therefore we give you the benefit of our experience.

EGGS AS THEY RUN FROM OUR PENS—\$10.00 per setting of 15 eggs; \$17.50 for two settings; \$25.00 for three settings; \$50.00 for 100 eggs.

EGGS SELECTED FROM OUR BEST PENS—\$15.00 per setting; \$25.00 for two settings; \$45.00 for four settings and \$75.00 for 100 eggs.

NO BABY CHICKS FOR SALE. Our new circular, which contains considerable interesting information, will be sent on request.

Homestead Campine Farm Box A Wayland, Mass.

1st Madison Square Cockerel, 1920
1st Madison Square Cock, 1921

who have developed them to their present high state of perfection, and who are entitled to say whether yellow shanks and beak are an important breed character or not.

We are not opposed to progress. We are sensible of the fact that the new Standard is to be in force from 1923 to 1931. In making it, the breeders of today must look to the future, and avail themselves of every advance that has been made in poultry knowledge. Perhaps it is desirable to include a sentence in the "Instructions to Judges," to the effect that shanks in hens faded as a result of heavy egg production shall not be considered a defect. In addition we believe it practical for judges to examine the pelvic arch to see if it is suitably formed for easy and quick passage of egg, and in judging body shape of egg-type breeds require that the judge examine the pelvic arch the same as he now examines the breast bone to see if it is straight and well formed. We believe it practical to specify a satisfactory abdominal development as one of the features of Standard excellence, and instruct judges to span the abdomen of females so that those with pent up vents will not win high honors in the egg-type breeds.

These additions could be written into the present Standard text. There is no call for an elaboration of production into a separate chapter. Might as well have a special chapter on feather development, tracing the growth of the plumage from the horny covered pin feather that grows out of the inner layer of skin to the webbed feather in which the barbs are hooked together with bar-bules and barbicles.

Standard makers have fulfilled their mission when they have set up as ideals those types of beautiful fowls in which the greatest usefulness may also be attained. They overstep their bounds when they add a chapter on the economics, the history and the physiology of egg production.

It was stated that the entire chapter on production would not occupy over twelve pages of the Standard. We challenged this statement and the figure was raised to twenty-four pages. Perhaps this figure was not intended to include illustrations, for Part III calls for elaboration with pictures.

In Part III a Standard female in exhibition bloom is to be shown. The same pullet will then be illustrated in heavy lay. Next the pullet will be shown during the molt. Following this the same bird will be shown back in show condition as a hen. The purpose of these four pictures is to illustrate an individual bird in different conditions of ovarian activity. A number of breeds are to be illustrated in this manner, such as White Leghorns, Barred Plymouth Rocks, Rhode Island Reds, etc. The illustrations are to be in colors, so they may show the changes in pigmentation, etc.

It was stated at Buffalo that the revision of the last Standard cost \$13,000. With a low treasury, Part III of the chapter on production, is in itself an ambitious program. The plan is benevolent in its educational features and would make a nice book in itself; but the Standard is not an encyclopedia of information. It already contains 368 pages, and is as big and expensive a book as the association can sell at the wholesale price of \$1.50.

This amazing chapter on production, which must strike the reader with sudden wonder, if not bewilderment, owes its origin to the New York meeting of last November. It was at that time that the purebred men agreed to production classes in the poultry shows, these production classes to be composed of Standard-bred birds that would score not less than the present minimum scores which are necessary to enable specimens to win prizes under the Standard. In other words, the production classes were to be open only to birds of good Standard quality, and the only difference between the exhibition and production classes was to be a difference between females at the highest point of health, just before pregnancy, and females in full lay. The purebred breeders agreed to having a Standard female in full laying condition illustrated in the Standard.

The purebred men felt that this concession would keep the utility mongrels out of the shows, and provide an opportunity for conscientious breeders who are endeavoring to combine breed character with egg-production values to show their birds and win prizes worth while.

The point should not be overlooked that production classes for hens and pullets will mean more first prizes in all classes. The new classification will result in a 1st cock, 1st exhibition hen, 1st utility hen, 1st cockerel, 1st exhibition pullet and 1st utility pullet. This will naturally lead to 1st exhibition pen and 1st utility pen, young and old. Such an elaboration of the prize schedule is, in itself, a doubtful expedient.

The fatal error in this magnanimous plan lies in the fact that the females that are shown and win in the exhibition classes will be referred to as the "fancy" kind, while those in the other classes will be known as the Standard-utility kind. Such distinction will reflect to the disadvantage of the high grade exhibition bird.

Seizing upon the opening up of production classes, the utility men outlined and have been authorized by the Committee of Forty to prepare the chapter on production which is to cover all the features of production from the "influence of domestication and breeding" to the "intensity, rhythm or cycle" of production. The chapter is to be such a full explanation and interpretation of theories that almost every line in the present Standard text of the different breeds and varieties will have to be examined in the light of the new hypothesis. The number of breeds affected by this new departure in Standard making cannot be determined from the skeleton outline now available. The purebred breeders of this country are thus brought face to face with a radical and revolutionary program of Standard revision.

We opposed this program at Buffalo. We believe that the idea of production classes is superficial. Pullets in full laying condition are not fit subjects for exhibition purposes. The eggs they lay in the shipping boxes may be easily broken and eaten, with the result that the pullets will return home as confirmed egg eaters. The confinement in the show room will interfere with their trap nest record for the year, for it is very easy to put a layer out of condition by changing her quarters and shipping her around the country.

A production class of hens cannot score. Hens that are kept laying so as to get the last possible egg out of them

It is results that count!

WHEN purchasing eggs, chicks or breeding stock, what do you buy—the breed or strain? While it is always advisable to purchase a Standard breed, you should be positive that in your selection you are obtaining the strain that will give you the greatest possible returns for your money and your time.

Parks' Bred-to-Lay and-Do-Lay Barred Plymouth Rocks

is the only strain of Barred Rocks in America today that has an unbeatable record for the largest number of eggs layed throughout the year.

In winter, when the others lay but very little, Parks' Barred Rocks are continuing to lay just as many eggs as they lay in the mildest weather.

Parks' Strain Records

Miss Wonder, 148 eggs in 148 days. Miss Graduate, 313 eggs in one year; 203 eggs in 210 days. Lady Martha, 323 eggs in one year; 400 eggs in 448 days. Miss Smarty, 325 eggs in 356 days—and a host of Contest winnings.

for the sake of a high record, are late molters. The first prize Barred Rock hen in the utility class at the last Boston show was in a pin-feathery state. That was January 1, and at that late date, there were no feathers to score on the first utility hen at Boston. According to production values, which the new chapter in the Standard is to standardize, this hen was worthy of 1st prize, yet she could not have been scored. The Standard says:

Condition shall be cut up to four points.

Shape of tail shall be cut three points when tail is only one-fourth developed; cut two points when only one-half developed; cut one point when three-fourths developed.

In December shows, where the late molters that have been cramed for eggs, are judged in old feather, there will be broken tail feathers, as a result of entering in and coming out of the trap nests during the season; there will be lack of lustre in the old feathers and brass.

These defects must be cut, according to the Standard, as follows:

Shape of tail shall be cut for missing tail feathers, one-half to one.

Shape of wings shall be cut for broken or missing feathers, one-half to three.

Lack of lustre on surface of plumage shall be cut one-half in each section where found.

Brassiness shall be cut one to two in each section where found.

Light colored shafting, or mealiness, which commonly appear in old feathers, one-half to one and one-half in each section where found.

How can birds in old feather be judged? We ask to know. And yet the Committee of Forty says that hens in the production classes shall score not less than ninety points to be eligible to first prize. Perhaps the Committee will eliminate the cuts cited above when scoring hens in production classes, the same as they voted that clipped flights shall not disqualify birds that are scored for records in egg laying competitions because

"frequently the birds must have their wings cut so that they may be kept confined." But, judges cannot score a wing that is not there, and clipped wings should disqualify if fairness of competition is to be assured in our shows.

Moreover, cuts for condition and missing, broken and faded feathers must be made if the production class is to be judged by the same standard that governs the exhibition class.

The committee recommends that a score card for eggs shall also be included in the Standard. Up to the present time, the Standard has not even stated what colored shell is laid by the different breeds. To include a score card and provide a basis for judging eggs will necessitate that both the color and weight of eggs of the different breeds shall be stated. It is pretty hard to breed only one color of brown-shelled eggs. It is comparatively easy to breed all white-shelled eggs, for in these shells there is an absence of color; but in brown shell eggs, pigment is deposited, and it

Buy Lord Farms

May, June and July Leghorn Chicks

We are one of the most experienced Leghorn Farms in the United States—in fact we are one of the largest breeders of White Leghorns in the United States. When we tell you to buy chicks during these months we are giving you good advice.

Earlier hatched Leghorns in a great many cases become stale from good laying before the real winter gets started, and prove indifferent layers on this account. Lord Farms May hatched Leghorns come to laying from the last of September to the last of October. ISN'T THIS AN IDEAL TIME FOR PULLETS TO BEGIN TO LAY?

June hatched Leghorns commence laying the latter part of October and should be in full lay before Thanksgiving. ISN'T THIS AN IDEAL TIME FOR PULLETS TO BEGIN TO LAY?

Last year we raised 1,200 pullets hatched July 2nd. We got some eggs from these birds in November. We got a whole lot in December, and from January 1st to March 15th, 280 of these pullets in one house, gave us an egg yield never less than 50%—some days we got as high as 210 eggs.

If you were going to enter a laying contest and was out to make a record in twelve months you would select birds hatched in either May or June. Why not run your own egg contest on your own farm? Get the idea out of your head that you have got to have April Leghorns. Our years and years of experience has proved to us that May hatched Leghorns pay better than April Leghorns. This advice is of no use to breeders of American or Asiatic varieties. You must hatch those birds earlier to get a good winter egg yield.

The Lord Farms believe in raising most of their pullets in February or early March, or not raise pullets again until May and June.

Grade A White Leghorn Chicks, \$28.00 per 100

Grade B White Leghorn Chicks, 25.00 per 100

PULLETS, PULLETS, PULLETS

March 15th the Lord Farms had 30,000 single combed White Leghorn chicks in their brooder houses. Thousands of these are for sale at eight to ten weeks old in May and early June. Thousands again for sale the last of July and August. No runts, no culls, every pullet guaranteed to be satisfactory to the purchaser at the time of sale.

Those who are contemplating entering in the poultry business on a large scale should communicate with the Lord Farms. There is no other farm in the Eastern or Middle States that can serve you both in quantity and quality to your better advantage.

All our pullets are raised this season on a brand new 260 acre farm. We have already booked orders for several thousands.

START RIGHT IN THE POULTRY BUSINESS

We issue an 80-page catalog—one of the most interesting Leghorn books in the country. Get acquainted with the Lord Farms.

LORD FARMS

METHUEN, MASS.

becomes difficult to regulate this process of depositing just the right amount of color pigment in the shells. The same hen may lay a slightly differently colored egg on different days.

To specify a particular shade of color for a Wyandotte's egg is loading another breeding problem onto the breeder. The living bird can be made a thing of beauty, and color of plumage is of primary importance. But an egg has only utility. No one stands in admiration before an egg shell. No one eats the shell. What difference is there in the value of a light brown or medium brown shell? Those who have laughed at the fancier because of his devotion to points of beauty in the colors of his living birds, have gone him one better in making a fad of the color of egg shells.

The precise shape of the egg is unimportant as long as it is normally formed, free from ridges and has a firm shell. Some hens lay a longer egg; others a rounder egg. One is as good in the frying pan as the other; one produces as

good a chicken as the other. Why complicate the breeding problem with such a non-essential? A standard of exact and specified shape for eggs will lead buyers to examine setting eggs that have been shipped to them, and the sellers will be getting letters like the one received by the baker which read: "Shipment of doughnuts unsatisfactory because the holes are not built according to the architect's plan."

From the report of the Committee of Forty it would appear that "production" is the alpha and omega of the hen business. But, more is to follow. A sub-committee on "Standards and Rules for Exhibiting and Judging Market Poultry" is yet to make its report. The subject of meat, like that of eggs, is to be given a separate chapter in the new Standard if the report of the Committee of Forty is adopted. Heretofore the Standard has set up ideals for breeds, and efforts have been made to preserve the types for which the breeds were developed, that the several breeds might be distinctive

in character and not come into close competition. Are the ideals of those from whom we have inherited the Standard to be cast aside and empirical innovations introduced?

After the chapters on production and meat are inserted in the Standard and the Standards are printed there is the possibility that the plates will be lifted and special editions of books printed on these two subjects. The Standard is to bear the initial expense; and then the association may issue a separate and smaller book on egg production and another to be known as a Market Poultry and Egg Standard; or both subjects may be combined in one book on production of eggs and meat. Thus the Association will be able to enlarge its publishing business.

It would not be expedient, following the association's recent experiences, to recommend the publication of a new book, so the Standard, after it is out, may be subdivided and one or possibly two new books issued separately, so that

HAROLD TOMPKINS'

SINGLE AND ROSE COMBS

RHODE ISLAND REDS

STANDARD AND UTILITY BIRDS

Hatch Your Rhode Island Reds in May and June TO WIN AT THE WINTER SHOWS

EGGS REDUCED TO HALF PRICE AFTER MAY 10th

**Experience has shown that more prize winners are
produced in May and June than any other months**

My matings for this year contain many of the best specimens of Rhode Island Reds in existence today. Not only do they include my famous winners at Boston, Rochester, Madison Square Garden and Kansas City, but the breeders that produced these winners.

These breeders last year produced for myself and customers the greatest array of show birds ever known in the annals of Rhode Island Red history, and are ready right now to furnish eggs that will produce the same quality for next season.

Not only have these birds been scientifically mated to excel in the production of show birds, but every bird in every mating has been Hoganized so that they may excel in the production of heavy laying stock.

The reports of my customers throughout the country prove that there is more Rhode Island Red quality produced from Tompkins Hatching Eggs than from any other.

Don't waste another season. Place your order at once to insure prompt delivery.

anyone who does not care to buy the whole Standard, which also deals with "fancy" chickens, may get all he needs by buying the egg book or the meat book.

The program of expense is to be saddled onto the poor old Standard, which is about the only remaining dividend paying property that the American Poultry Association has. Its other book ventures have been a failure. During the war, two new books were issued by the A. P. A., one on Poultry Feeding and the other on Back-Lot Poultry Keeping. Their text was furnished at no cost to the association, yet the publication of these two books cost \$1,562.03. The promoters of the books sold advertising to the amount of \$625.00, leaving \$927.03, which was paid out of the association's treasury. Only a few of these books were sold. The secretary of the A. P. A. now has on hand most of the edition, which consisted of 20,000 copies.

The Plymouth Rock and Wyandotte Breed Books and Standards have cost the A. P. A. \$12,839.85. The full editions of the two books amounted to 4,000 copies, and when sold at \$2.00 each, the wholesale price, will net the association \$8,000 or nearly \$5,000 less than the cost of production. The Plymouth Rock Breed Book is now completely sold out, the type has been thrown-in, and there are no electrotype plates to print further editions to help pull the account off the debit side of the ledger.

Already \$2,997.79 has been spent on a market poultry and egg Standard, and the first book has not been printed.

In ten years, the A. P. A. took in \$184,487.56 in honest-to-goodness coin of the realm, yet it has appropriated money on nearly every vision that has been pressed by any truculent and insistent member, and today the Standard of Perfection is about the only remaining asset. Now the fate of the Standard hangs in the balance. Is it to remain a Standard of Perfection for judging purebred fowl, or is it to become a book on culling? Is it to remain the back bone of the finances of the American Poultry Association, or is it to become a vehicle to carry across a new book on production and a new market poultry Standard?

The fate of the A. P. A. itself may rest on the outcome of the present uncertain state of affairs. The dollars of the A. P. A. come from the purebred breeders. It may prate about being the guardian of a billion dollar industry, but it is fundamentally a breeders' organization and it can only prosper as it recognizes its limitations and accepts the responsibility of its stewardship. The easiest way for it to alienate itself from its friends, and go completely bankrupt, is for it to get out of its line and put on a lot of side shows.

The purebred bird will not go bankrupt. Modifications of type will take place in the future as they have in the past. Breeders will progress. They will not overlook the important characters that are indispensable to strong, robust, symmetrical, beautiful birds. The men who made the breeds, who reduced to systematic form the great medley of barnyard forms and colors, can be trusted to reinvest the best blood of the best birds, from year to year. Their birds will win at New York, Boston and Chicago. No one of the three is an A. P. A. show. No committee has jurisdiction over the three really important shows of the United States.

QUALITY EGGS & STOCK, KNOWN THE WORLD OVER

Scott's Reds
WRITE FOR PRICES, MATING LIST
C. P. SCOTT,
BOX A PEORIA, ILLINOIS

And the types that are shown at the great annual events by the master breeders and win under the authoritative judges of the land, will be the types for which high prices are paid. Revising the Standard along new and untried lines will not change either the types or judging practice in those shows where the types that win set the ideals for breeders. Overloading the Standard will only diminish the usefulness and the sale of the book. It will only help to weaken the already weakened American Poultry Association.

It is unfortunate that the Committee of Forty should have overlooked the fact that Standard ideals are living things and that their growth can be neither hurried nor retarded. Instead of accepting Standard ideals as living visions that are developing and unfolding and maturing from year to year in the minds of breeders, the Committee assumed that the Standard is a piece of property, like an apartment building, to which a couple of rooms can be added and the rents increased.

CURRENT NOTES AND COMMENT

When to Hatch Winners.

D. Lincoln Orr, secretary of the Madison Square Garden Show, says: "April, May and June hatch for the Garden winners. May 15 to June 15 is about right for color special."

Last year we hatched three settings of eggs of different breeds on June 15. A Leghorn was the first to lay, starting January 1. She beat out the last of birds of the heavier American breeds by only 15 days, for all of the pullets were laying on January 15.

There is a great deal written about early hatching, and the possibilities of early June hatching are too often overlooked.

Later hatching need not be confined to the small breeds, such as Leghorns. Early June hatched Rocks, Wyandottes and Reds will make elegant chickens. We have practiced early June hatching for a number of years.

* * *

Leg Weakness in Chicks.

Leg weakness is a common trouble in chicks that are grown on dry board floors. The weakness usually develops when the chicks are about two weeks old. They may do very well up to this time. The solution of the problem is to get the chicks on the ground. Their legs will grow strong on a cool, moist earth.

Nature never intended that a chick should be warmed from the bottoms of its feet up. Her plan is for the chick to run on the cool ground, and for its body to get warmth by its back coming in contact with the warm body of the mother hen. Modern hovers, following nature's plan, deflect warmth downward onto the chick's back.

Provide plenty of heat under the hover so that the chicks can get warm quickly when they need warmth. Then let them enjoy some freedom on the grass or ground.

Even as I talk out this message, the orders for "Famous" Ancona hatching eggs are commencing to pour in from every quarter of America. Thousands of settings will go out this spring to people who have tested "Famous" Anconas and want more of them—want more of them direct from the world's leading Ancona farm.

And I will record orders from hundreds of new names—names of men and women who have heard of the "Famous" Ancona victories—of the amazing annual demonstrations of superiority at Madison Square Garden year after year—of the individual flock and egg laying records, orders from men and women who have studied up on Anconas and became convinced that they are the world's leading egg producers.

A word of warning! Hatching Eggs and Baby Chicks from my best pens are going first and fast! Ancona birds are fast workers—and you will have to be, if you avoid disappointment in getting your Hatching Eggs and Baby Chicks. They are ready now. Order from catalog today.

Dead Chicks in Shell.

When eggs do not hatch properly the trouble may lie in the breeding stock that produced the egg. If the hatching qualities of the eggs are good and the embryos develop up to the point of departure from the shell, and then die, the trouble may be due to the conditions existing during the period of incubation.

There are three factors that govern the process of hatching. The first and most familiar is temperature. Usually the temperature is well regulated and little responsibility for poor hatches can be attributed to it. Sometimes the thermometer registers incorrectly, but careful incubator operators use a tested thermometer in which they may repose confidence.

The two remaining factors that influence the development of the embryo are ventilation and moisture. When hatches are poor the operator should juggle with the ventilation and moisture.

The developing chick is supplied through the porous egg shell with oxygen from the air. If the room is stuffy or laden with fumes, the air is vitiated. When the air in the incubator room is pure it may be that enough of it does not enter the egg chamber. It is sometimes advisable to drill holes in the bottom of the egg compartment. If these are later found to be not needed they can be plugged up with corks.

Moisture, like air, is essential to life. A desert is incapable of supporting life because of its lack of moisture. The hen supplies a large amount of water to the egg, but this water content decreases as the period of incubation continues.

The warm air in the incubator may help to diminish the quantity of water within the egg. Where air is warmed its moisture carrying capacity is increased, and it seeks to take up moisture to equal its carrying capacity. If there is no water vapor in the air of the cellar, and none in the machine it is frequently advisable to place in the incubator a pan filled with sand or dirt, which is partly covered with water. The numerous moist crystals of sand provide a large surface to come in contact with the warm air in the incubator and give off moisture.

Much remains to be learned about "dead in shell." The porosity of the shell, inherited tendency to abortion, or the feeding of the stock may influence it, but in the practical work of incubating eggs only the mechanical factors of temperature, ventilation and moisture can be regulated.

* * *

Undercolor Again.

Rev. Harwood in his article on undercolor in this issue refers to the Standard makers as "prematurely describing" the correct undercolor in some breeds.

That was the argument of Robt. Essex at the committee of forty in Buffalo, in asking that the standard color for speckled Sussex be changed from "slate shading into white at base," to "slate shading into white, or red, or both." Mr. Essex maintained that no one knew what was the right undercolor from a breeding standpoint, and that in a tri-colored variety all three colors should be permissible.

New Washington Hatchery, Dept. J, New Washington, Ohio

in the undercolor. The motion carried.

Charles D. Cleveland, voicing the same argument advanced by Rev. Harwood, asked for the elimination of undercolor in Standard descriptions. He said: "If I produce a white bantam by using a bluish white undercolor, that is my business and my problem."

That the relative importance of undercolor is eliciting renewed consideration is a hopeful sign for breeders of penciled and laced varieties. These beautiful fowls have been handicapped by radical undercolor requirements. Rev. Harwood, as a breeder of Silver Penciled Wyandottes is serving the best interests of the breed in urging that dark slate undercolor should not become a fad among breeders of these fowls.

* * *

Down That Shows on Shanks.

It is not uncommon for chicks of some of the clean-legged varieties to hatch with a little down on their shanks. As the birds grow older this down may disappear and never develop into stubs.

* * *

A Reason for Disqualifications.

Disqualifications are the buyer's safeguards. Defects are always a matter of degree; a slight defect or a bad defect. A disqualification means "out," and is not subject to argument.

* * *

Fresh Ground.

Starting and growing chickens on the same ground year after year is a fertile cause of disease and trouble in chicks.

The farmer does not put the same field in oats year after year. He rotates his ground.

The colony houses for chicks should be moved to fresh ground every second year. The soil of the old run should be broken up and corn, oats, alfalfa or garden truck grown on it. The plowing of land and growth of a new crop is beneficial from the standpoint of sanitation.

Many brooder chicks that are started and kept confined in a very small run contaminate the ground in a very short time, and by the time they are eight weeks old, droop their wings and fail to make a satisfactory growth in response to the feed they consume. The trouble lies in the fact that every time they pick up a grain of feed they take into their system the infection of the soil. Get them on fresh ground, and above all, feed them on fresh ground.

Do not overlook the importance of fresh ground.

* * *

The Big White Rock Transfer.

Mr. Chapman shipped the entire Owen Farms flock of White Rocks to Wilburtha Farms without the loss or disability of a single bird. In offering the Wilburtha Reds for sale, Mr. Chapman says:

The demand is so great in any of the popular varieties that a breeder can give his whole time to one variety and can sell all the birds that the ordinary poultry farm can raise at good prices and, of course, give better service to the public. At the beginning of the war, we were breeding six varieties, and in dropping a couple of them, it has put us in better position to take care of our business.

The White Plymouth Rock is a spe-

1887-DAY-OLD-1921 CHIX :- DUX

May and June

Are the two months during which NATURE naturally re-produces herself. The steady, warm, dependable weather makes it possible to raise day-old chix with a minimum of care and without expensive equipment.

With a comparatively small investment you can raise pullets which will lay this Fall and Winter when eggs are high.

With day-old stock, bred from Niagara Farm strains, with 35 years of experienced breeding back of them, your success is assured.

Anconas, Barred Rox, White Rox, White Wyandottes, Rhode Island Reds, Black Minorcas, White, Buff and Brown Leghorns, Mammoth Pekin and Colored and White Indian Runner ducklings, bred from Hogan tested stock with heavy egg-producing ability, hatching twice a week, Monday and Wednesday.

Orders filled promptly from 25 chix up to 5,000.

Marshall, Illinois.

cial favorite with Chapman. He has not only watched its progress, but had a part in it, for many years. A recent letter from him tells something of the breed's early history. To quote:

It was about twenty-five years ago that I took up the breeding of White Plymouth Rocks. At that time, a bird named White Cloud, owned on Fischer's Island was the king pin in White Rocks. He had won twice at the Garden. I remember this bird well; he was of medium size, rather blocky in build, but a symmetrical bird. His point of superiority was his pure white color. Up to that time, most White Rocks were very poor in color. I secured two of this bird's sons and their blood flows in the Wiburtha flock to day.

Shortly afterwards, Harry Graves began showing his famous strain of White Plymouth Rocks from Nigganun, Connecticut. Graves' birds were longer in body and larger; and had more abundant saddle feathering. This was really the beginning of the modern type of White Plymouth Rocks which has proved so popular.

I think today that perhaps the only defect from the standpoint of a perfect utility bird, especially for heavy egg production, is that there is a tendency to breed White Plymouth Rocks too large. If the public, who wish to breed them mostly for the egg production and general utility qualifications, would be satisfied with birds around Standard weight, the White Rock breeders could send out birds that would meet their requirements perfectly. But the majority of our customers close their letters by saying: "Mr. Chapman, send me a bird one or two pounds over the Standard weight." Occasionally, a high egg record bird will be of extra large size, but the history of the egg-laying competitions is that the medium size bird, in all breeds, is the type to select for heavy egg production.

Mr. Chapman concludes his letter with a personal note, as follows:

I did not have an opportunity to look

over your book on the American Breeds until the last day or so. I think it away ahead of any similar work I have ever read and intensely interesting. If I could have had some such similar work twenty-five years ago, I would have been winning at the Garden with regularity a great many years earlier. Therefore, I especially recommend it for beginners, those who are just starting in with any of our American breeds.

* * *

The Latest from Theo. Hewes.

Harvey C. Wood will judge Light Brahmas at the next Chicago Coliseum Show. At the same time he plans to bring to Chicago and put in display cages, some of his own birds, so that breeders may see what he is aiming for in his own breeding operations.

Theo. Hewes announces that Wm. A. Wolford will serve as assistant secretary of the Buffalo Show. Mr. Wolford has a wide acquaintance among poultrymen in western New York state and he will be a valuable man in handling much of the preliminary work in connection with the show.

Theo. Hewes is now down on his farm at Hot Springs, Arkansas. He says that he knows that it is the best farm in the state because the man who sold it to him said so. He writes:

For several years I have been spending about two months of my time and all the money I could save up, in Hot Springs. Every time I have come here I have pledged myself that I would buy a farm the next time, so this time I bought the farm and in the future when the show season is over, it's Mountain View Farm in Arkansas for Dad.

I am just three miles from Hot Springs on the best road in the state and I am going to duck the cold, late winters in Indiana and come here where one can work out of doors

twenty-five days every month in winter and not freeze to death doing it. The man who sold me this farm told me that he had lived on the farm for four years, had worked twelve hours a day, including Sundays, and had only lost \$1,600. He hated to part with it and it was only because he loved my money better than the farm that he finally decided to let go.

His brother owns a livery stable in Montana and offered him a job, and has set aside two box stalls for him and his family to live in. The box stalls will be quite an improvement over the house he sold me, in fact I think the man did real well in making the change.

I call the farm "Mountain View" as it is only a half mile to the foothills of the Hot Springs mountains. The view is wonderful, in fact I believe it is the greatest asset the farm has. But my wife says she cannot cook the scenery, and would rather have a regular diet of hog and hominy. But you know women are sort of funny that way.

When I bought the farm I looked over everything the man had including a cook stove with two perfectly good legs, a one-lunged hay burner with a set of chain harness with a broken backband. I might mention here that my one-lunged wonder is blind in one eye and hasn't seen anything out of the other eye since Abe Lincoln was elected; but he knows more about "gee" and "haw" than a lot of people who will read this notice.

Those of you who have visited the world's greatest health resort (that is what it says on the signboards) know there are a few loose rocks in this country. I will guarantee that I have enough rock on my farm to build a monument to every man that voted for Wilson and throw in a mile of stone fence for good measure.

In planting corn or cotton we dig up one big rock, plant the hill of grain and then put two small rocks on top of it. That also is the way we raise the corn for the moonshiners and they do the rest. They make a brand of whiskey they call the White Mule. It gets its name from its kick. It is guaranteed to make you drunk quicker and keep you drunk longer than any moonshine whiskey yet discovered.

Three revenue men found a still two years ago. They sampled the goods and haven't got sober enough yet to make an arrest

Save Your Chicks!

**Kill Rats by Science—New Way—
No Poisons—No Traps—Used with
Tremendous Success by Thousands
of Poultry Raisers.**

The VIRO Scientific Method of killing rats has been used in Europe for years.

The one PERFECT METHOD FOR THE POULTRY YARD. Absolutely guaranteed to rid your place of every rat and mouse—*positively guaranteed* not to harm chickens, dogs, or any valuable live stock.

Safe—sure—quick—cheap!

Kill Rats Without Poison No Danger to Poultry!

GET RID OF RATS!
Save the chicks they kill — the eggs they break — the grain they eat and spoil! Kill those rats, without risking the lives of your chickens, by using VIRO.

VIRO will make your rats disappear as if by magic. It's guaranteed to do this — or your money back.

New Discovery

Entirely different from all other rat killers. Discovered by famous French scientist. Now used all over the world on ships, wharves, warehouses, wherever rats are thickest.

Rats Die Off the Premises

VIRO makes them die outdoors seeking water. No rotting odors. Only perfect rat killer invented. Approved by highest scientific authorities.

Harmless to All But Rodents

Remember — VIRO is different from all other rat killers because it is not a poison. Even if your chickens, dog, cat, hogs, cows or horses, should eat VIRO-ed bait, no harm will result. Don't use dangerous rat poisons! You don't have to. VIRO is sure death for every rat, mouse or gopher, but perfectly harmless to everything else.

Kill your rats! Don't tolerate them! Government authorities estimate that rats cost a farmer more than his taxes. From figures given, it has been determined that a rat killed means \$10 saved.

VIRO can be used anywhere. It kills mice in the home, rats in the barns, gophers in the fields. An ideal rodent killer. Order a bottle today. Use it. Your place can be freed of every rodent.

Guaranteed to Kill Every Rat—or Money Refunded!

I guarantee that VIRO will kill every rat and mouse on your place. If it doesn't, I'll refund your money without argument or question. Order a bottle today. Use it according to directions. If there's a single rat or mouse left after a few days, you get your money back.

Send Coupon Now! Don't Delay!

Accept this square deal offer. Fill out coupon and mail. Don't tolerate rats any longer. They spread disease; cause fires; destroy property. For just \$1.00, I'll send you enough VIRO to clear a barn or house of rats. If you need more, send for more. I'll leave that to you. Only act now! Get rid of every rat! Here's your chance. Mail coupon today sure.

J. S. PENNINGTON

Box A

Plainfield, Ill.

This is a wonderful country and a wonderful climate, the falls, winters and springs are delightful, but the old-timers tell me that in July and August it is seven degrees hotter than the place where war is made. But I never was in h—I in July or August as the show season doesn't open that early, but I will tell the boys at the Coliseum this winter how hot it is in Hot Springs in July and August and if we hit the kind of weather we usually do at the Coliseum Show all the boys will want to move down here for a while.

They can raise anything in Arkansas that can be raised in any other state, and some things that cannot be raised in other states; for instance they can, and do, raise a negro who knows his vote don't count unless they want it to; and believe me, you can't do that on South State street in Chicago.

This is a wonderful fruit country when it hits. The largest peach orchard in this country is less than thirty miles from Hot Springs. Last year the fruit on this orchard brought the owner something like one and a half million dollars, and it looked like a repeat order for last year, but the Easter blizzard changed the man's plans.

One can get awfully enthused by being here and looking at conditions at first hand. But if you never tore down forty rods of barbed wire fence and moved it a quarter of a mile and then set it up again all by yourself you are missing one of my real treats.

* * *

POULTRY CENSUS FOR 1920.

Reports on agriculture in twelve states have been made by the Bureau of the Census. A summary of the statistics on poultry and eggs are published herewith. It will be noticed that when this

	Number of Chickens on Farms	Dozens of Eggs Produced	Number of Chickens Raised

1910.....	691,941	4,672,866	971,917

census for 1920 was taken the number of chickens in four New England states was considerably smaller than in 1910. Poultry raising in New England was seriously affected during the war, due to the difficulty of getting feed and the high price of feed.

It will also be noticed that the four New England states are a small factor in poultry production as compared with some of the other states. The state of West Virginia has as many hens and produces nearly as many eggs as Vermont, Maine, Massachusetts and Rhode Island. The growing of poultry meat in New England, however, appears to be relatively more important than the growing of chickens in some of the other states. New England has long been known for the fine quality of its

market poultry, and producers have the benefit of the best poultry-meat markets in the world. A great deal of poultry is consumed in New England, and buyers are critical of the kind of carcasses they purchase.

Ohio and Maryland show a large increase in the number of chickens on farms in 1920 compared to the number reported in 1910; yet there is not a corresponding increase in the number of eggs produced. The reason for this condition undoubtedly lies in the fact that grain was very high in price in 1919, the year on which the 1920 census for poultry production is based.

Receipts of eggs this year from Ohio and other central west states are exceptionally heavy, and movement into storage is above normal. Feed is cheaper this year and, instead of marketing nearly all the grain, farmers are feeding more liberally. Feed makes eggs.

The situation this year in the egg market is still confusing. Some contend that the season, having opened early, will close early as the result of the farm hens going to setting. Others contend that a hen that would lay 36 eggs in a late season may lay 60 eggs this spring as a result of favorable weather conditions and liberal feeding on the farms.

The government reports that: "Prices continue to be sustained by the demand for best quality. Both storing and consumptive demand have been very selective, and on the poorer quality southern and southwestern eggs, prices have been shaded to keep goods moving."

Kill the Rats.

For 5,000 years the war has been going on between rats and men, and despite the progress the latter has made he has never been able to conquer the rat. During this warfare the rat has caused the death of more people than all wars put together. Government officials estimate that the damage done by rats in this country alone amounts to \$2,000,000 a year. It takes 200,000 men to make up what rats destroy. But this is not all. Rats have been proven to be carriers of disease.

Rats require that the poultry raiser put up a good fight. They are particularly fond of little chickens, and at this season of the year, which is the rat-breeding season, they are a pest. Get after them with all modern methods and exterminate them before they inflict a loss on your flock of growing chicks. Clean up the rats in the spring, and do the job thoroughly, and you will not be bothered much during the remainder of the year, unless you live in town, where rats can migrate to your place. In this case eternal vigilance is the price of freedom from these rodents.

Sex Indicators.

Re the "sex indicator" humbug as related in your recent "expose" editorial. I experimented with one that the introducers had the nerve to send me on a 40-days' trial without pay, with full confidence in the "fool 'em" principle. The indicator will work alike on eggs, teddy-bears and nails. Made a number of tests on different lines. At first these were amusing, sort o' fascinating.

I made the final, convincing humbug tests with a considerable number of "double tested clears" out of an incubator, at three and 7 days. By the indicator all had either male or female germs, and these were live germs. I changed their "sexes" as many times as the "tests," or rather the "no tests" at all, were repeated and always with negative results as to their being infertile. A colossal humbug in a small package.

Its agents are cutting prices. The first quoted price of \$3 is reduced to \$1 by others. Received four different circulars from as many agents during the past week, their "sucker list" being evidently gleaned from the classified ads of poultry journals.

No responsible dealers in poultry supplies are offering the humbug that I know of, though some poultry journals of reputation are carrying the ads. P. C. Gori.
Pennsylvania.

SPRING WORK IN THE POULTRY YARD.

(Continued from page 560)

Such flocks need a spring cleaning and should be given epsom salts, followed the next day with a small dose of sulphur. Epsom salts should be given in the quantity of about one pound to 100 hens, which is equivalent to about one teaspoon level full to the hen. This treatment will rid the system of poison and cool the blood. It will cure all mild cases of liver trouble and in fact renew the fowls generally. They will now be more active and will have much better appetite.

To continue the winter feeding ration will soon put them back where they were. They now need more green food and less concentrates than formally. It will also be a good plan to put about a teaspoonful of tincture of iron in each tub of oats you soak for sprouting. Buttermilk is the best thing there is for hens in this condition. Give what they will drink in one-half day. It will help to clean out the digestive organs, cool the blood and for layers or market fowls, is a substitute for green food as well as an animal food. When you start to feed the buttermilk cut down on the other protein concentrates accordingly.

Provide Shade.

Next to fresh, clean, cool drinking water for the growing youngsters, shade is of great importance. Now is the time to provide for the health and comfort of the birds during the summer season. They are then going to require colony roosting houses that can be opened to every breeze that blows and a range that provides shade in abundance. A frame of boards or burlap makes better shade than none at all but it is very poor shade compared to that supplied by a big clump of leafy bushes or low trees. The latter will supply cool shade, while the former will do little more than protect the fowls from the direct rays of the sun.

If you haven't the trees or bushes on the range where you are going to grow your chicks or summer your hens, you can provide an excellent substitute by planting this month a patch of sunflowers or corn.

The sunflowers will make the most shade and when ripe the oily seeds are excellent for the molting hens, and the chicks that are getting their adult plumage at this time. If the heads of the sunflowers are cut off with a long knife and dried, the fowls will take care of the thrashing.

If you plant a large field of corn or sunflowers you will notice that the chicks will work in the meadow land early in the morning, returning to the shade of the corn, as the sun rises in the heavens they will continue to work there for several hours, securing considerable meat life, and not returning to the meadows till nearly sundown in the evening.

Shade of some kind is essential to the production of good plumage on fowls of any color, but probably buff and red fowls show the effects of a lack of shade the most of all. The sun will not only spoil the luster and the silk-like finish of the feather but too much will fade the color as well.

AMERICA'S GREATEST POULTRY REMEDIES

RAISE 90% TO 100% OF YOUR CHICKS

KEEP YOUR CHICKS ALIVE. OTHERS ARE DOING IT; SO CAN YOU.

Don't let your chicks die with white diarrhea, gapes, going light, weak legs, stunted, not developing; give them Wacker's Chick Tablets in the water from the start, then watch 'em grow. By using these tablets you make chick raising a pleasure.

BETTER THAN GREEN FOOD

Just dissolve WACKER'S B-T-G-F TABLETS in the drinking water. Your chickens will be in prime condition, and an increased egg production will result. No meat scraps are necessary. If you are not satisfied we will return your money.

All Tablets, 300, 75c; 1,300, \$2.50; 5,000, \$7.50. Positively Sold Nowhere Else.

QUAKERTOWN, Box 202, PENNA.

IMPROVEMENT BEGINS IN THE BREEDING YARD.

(Continued from page 559)

does not disqualify unless it runs up well under the eye. My interpretation of this rule is that white extending beyond the earlobe, or, in other words, if it appeared in that portion of the face that is supposed to be red, it disqualifies. At any rate it is poor policy to use a bird that does not have a face of a deep red color. We often find White Leghorn males that have a face that is rather a dark pink color. These birds will invariably show a tendency to throw white faces both in cockerels and pullets.

In some breeds, especially in Wyandottes, Orpingtons, and the other larger breeds having clean legs, we are apt to find stubs on the shanks or down between the toes. These two faults, like many other defects, are bad things to reproduce and birds having them should never be used in a breeding pen. It is often the case that breeders have a bird, which happens to be the best in the flock, which shows a defect similar to those I have mentioned, but they take a chance and breed him in an attempt to improve their flock in some sections in which this particular bird may be exceptionally strong, underestimating that they are breeding a serious defect that will throw out every bird that shows it and the flock instead of being improved may actually be ruined. It is a very easy matter to breed in a defect but it is much more difficult to breed it out.

Balance Your Breeding.

In this connection we might say that too many breeders are over enthusiastic when it comes to color. In parti-color varieties, especially in barred, laced or penciled fowls, a breeder is apt to be carried away with a specimen that has good markings but is absolutely lacking in type. What use is color when there is no type? What chance has a beautifully Barred Rock when it has Wyandotte type, and what use is there in breeding such a bird when the improvement of a flock is taken into consideration. Get the shape that is typical of the breed first and then go after color. It is like building a house. First the framework is erected according to the plans of the architect and when that is done, comes the finishing touches such as painting and decorations. The same rule applies to the breeding of poultry. The Standard of Perfection gives the plans together with an illustration of the breed, and it is up to the breeder to try to produce birds that comply with the ideal. The descriptions of color are the specifications and they are added to make a perfect specimen.

In mating birds type and color must constantly be kept in mind and one must not be overlooked on account of the other. A winning bird must possess both type and color.

Chance matings from year to year may result in a few good birds although there is nothing certain about them. To be successful in building up a uniform, high-class flock, a constant effort should be made each year to improve in some section or another until nearly all the birds are uniform in type, color and egg production. It can be done and is being done by those who are alert, who study their variety and the product of their matings, and are guided in the future by results in the past.

Cosh's Barred Rocks

Special Reduction of Breeding Birds and Hatching Eggs.

After May 15 we will reduce prices on hatching eggs and breeding birds just 50%. This affords you an unprecedented opportunity to purchase into this richest prize winning blood at the lowest possible expenditure.

Write us fully telling us just what you are in the market for and your letter will have our prompt and personal attention.

See last month's ad for our crashing victory at the Great Philadelphia Show.

Prices of hatching eggs, \$15 per 15, \$28 per 30, \$40 per 50, and \$80 per 100. Reduced to one half after May 15. We are now booking orders for delivery at these dates and will ship earlier if we are caught up with our present orders. Address,

Stop Hatching Weak Chicks

With Cheap Incubators

Remember, it is not how many you hatch that counts, but how many you raise. A Queen costs but little more, and the extra chicks that live and grow soon pay the difference.

Queen Incubators

Hatch Chicks That Live and Grow

Accurately regulated—taking care of a variation of 70 degrees without danger. Built of genuine Redwood—very scarce in these days of imitation. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. Catalog free.

Queen Incubator Co. Lincoln, Nebr.

THE STEADY POSITION OF THE WHITE ROCK.

(Continued from page 563)

Rock is a combination of beauty and utility.

An article on White Rocks would not be complete without a word as to the "why for" of their superiority. Why is it that White Rocks have so many desirable features blended into one bird? The answer is that of all breeds White Plymouth Rocks have perhaps attracted more good painstaking breeders, men who were students and knew how to mate in order to improve what they were working with. These men were fanciers, yes, artists fashioning their masterpieces in living specimens. They strove not so much for monetary returns as for the satisfaction of producing something better than had been produced before. To these men White Rocks owe their ever increasing popularity, from the early days when, starting with the old time Barred Rock sports, with their stilty legs, short backs, high tails, brassy color and trough-shaped breasts and bodies, have bred up the White variety to that high point where it is now.

But we must not stop here. We must keep up the good work, giving our closest attention, especially to the matings we put together. Really the art of combining or putting together two birds in order to produce a better one is deserving of more attention than is usually devoted to this work by the average poultryman. In order to obtain the best results it is absolutely necessary to be very painstaking in the selection of matings.

Realizing the vast importance of this fact, I shall endeavor to explain how matings should be made to effect marked improvement in the forthcoming generation. It is a difficult proposition, as it can be said that no two matings are exactly alike, but persistent and careful study will eventually show improved results. If one goes about it in a haphazard, slipshod way, failure is inevitable.

Mating White Rocks.

The first thing of importance is to select good females free from disqualifications, such as white lobes, stubs, etc., and be sure you do not overlook the utility values such as size, appearance, laying ability and health. Do not select a sick bird no matter how good it may be otherwise. Vitality is one of the greatest assets in the bird and should not be sacrificed at any cost.

The next important step is to select a good male bird to head your pen. If you can do so from your own yards, well and good, but if not, buy one, your chance of success largely depends upon the sire. Get a bird, a vigorous one with good blood lines and one that will match your females.

Now, if you can only raise, say, seventy-five birds a season, do not put ten birds in a pen, when you have only four or five females good enough for improved mating, always remember that quality is better than quantity.

Supposing a breeder has enough good birds to make four pens. At the head of pen number one is a cock bird fitting to the following description: good five point comb, grand shape, but a trifle low on legs. At the head of pen number two he places another

312 Eggs, White Wyandottes

Eggs—Cockerels—Hens—Chicks—Half grown stock. From my high class trapnested layers; records as high as 312, 302, 292, 280, etc. It will pay you to write for mating list and prices. Don't forget my surplus and half grown stock sale; it means saving of dollars to you.

JAMES E. CUSHMAN Route No. 1 Rockland, Mass.

cock bird with a good four point comb, slightly irregular in front. He has good eyes and color, good back but his tail is too long and narrow, comb too large to fit the head, perfect color, but with pale legs. At the head of pen number four is another cockerel with a flat breast, unevenly serrated comb, broad back, but not quite long enough, yet very good in other respects.

Now, the breeder selects his females. He finds one that is a little high on legs, is pure white, has an excellent red eye and is fairly good otherwise. He readily sees that this female will make a perfect mate for the cock bird in pen number one.

The next regular female his eye rests on is a nice pullet, with a six point comb, regular and even in front, short well spread tail, but is a little creamy in color. He finds that this female will mate finely with the cock bird in pen number two.

Then he picks up a hen, very broad in back, with some cushion, fine low comb, creamy in color, yet with fine yellow legs, this hen he places in pen number three.

He now runs across a hen with a good full breast, long body, but not broad enough, yet all the good qualities to mate her with the male in pen number four. In this way he proceeds to fill all his four pens.

This is the manner that you should follow in your matings. Look over your females and carefully select and mate them with the male birds so that the faults of one are offset by the good points of the other. After finishing the mating in each pen go over them again and again to make sure that you have mated and matched every pen properly. Do not be afraid of taking too much time.

The foregoing illustrates my idea of mating fowls to obtain best results. You will readily see that it is not absolutely necessary to have high class show birds in order to produce high class stock. Of course the better we can get them, the better we like it. However, the point I desire to bring out is that for the best results you must give the matter careful study. Get as good birds as you can obtain and match them in blood lines and individuality.

Blood will tell. Learn your own birds. Make it a point to toe mark or wing band as many of your chicks as possible so that you will know the blood lines and so that you can intelligently mate your stock next season and you will be on the way that leads to more and better White Rocks.

Here are four things to bear in mind when you go into your yards to mate your pens:

Have vitality in every breeding bird. Select birds only that show good egg-laying and marketing qualities. Be positive that the birds match perfectly. Keep track of the blood lines in your birds by toe marking or wing banding.

Feather Eating.

Hens that have contracted the bad habit of feather eating can be cured by turning them out on free range, reducing their feed, and obliging them to forage. When foraging on the range they forget about feather plucking.

Confirmed feather eaters cannot be easily cured while confined in small runs. The skin turns red where the feathers are plucked and the skin is exposed to the sun.

Give Your Late Chicks Every 'Chance to Grow Quick and Sturdy

IT DOESN'T pay to take any chances with those late hatches

—the season is too far gone. Your success depends upon your ability to grow sturdy, fully-developed pullets and cockerels in quick time by using most efficient methods.

THE ELLIOTT POULTRY FARM

Box 87, R. No. 7

Mansfield, Ohio

S. C. BLACK LEGHORNS.

By MILO L. MYERS.

In all my experience in breeding, ex-
perimenting with and exhibiting I have
never written for publication but one
article in reference to poultry, and I
write this only on request of the editor
of this paper. Each and every class of
poultry and each and every variety
thereof have their merits and demerits,
and the breeders of each class or vari-
ety have their certain set opinions;
and having due respect for the other
fellow's opinion, and knowing that some
of my statements may be challenged, I
write this article hesitatingly, and not
for any good that I may personally de-
rive therefrom, but solely for the pur-
pose of informing the reader and giving
him some idea as to the description,
quality, ins and outs, and general use-
fulness of the Single Comb Black Leg-
horn.

Being raised on a farm and having
there had considerable experience with
several varieties, moving to the city
some twenty years ago, and desiring to
keep a small flock of chickens, I chose
the Silver Laced Wyandotte. I also
brought from the farm with me a trio
of Single Comb Black Leghorns. I be-
lieved both varieties suitable and well
adapted for utility, fancy and city pur-
poses. I soon discarded the Wyandottes
and have ever since been breeding and
exhibiting Single Comb Black Leghorns,
exclusively.

Black Leghorns Twenty Years Ago.

At that time there were but few Black
Leghorns in the United States. When I
first saw a pen of them their beauty at
once appealed to me. Their black in
color suggested that under all conditions
they would always appear clean. A yel-
low legged Black Leghorn was seldom
seen at that time. The birds had short
backs, high tails, large combs and dark
eyes; they were not of Leghorn type
and layed a small egg.

I had a picture in my mind of what a
beautiful bird a Black Leghorn would
be if of the shape and type of the White
Leghorn, and so started to produce a
bird that would in some degree fulfill
the ideal bird that I had in mind. I at
once adopted a system of linebreeding
(inbreeding), and it is wonderful the
results that can be obtained if you keep
at it with a fixed purpose in mind.
Shape, type, length of body, carriage of
tail, the color of plumage, the color of
legs, the eye, the ear-lobe, the comb, the
size, the color and size of the egg and
the number per hen can all be changed
and improved according to your own
idea.

The breeders of yesterday and of to-
day realized the change that could be
made by a fixed line of breeding, with a
definite purpose in view, so that the
Single Comb Black Leghorns of today
are so far removed from those of yester-
day that as to type and shape they are
the equal of the White. They are today
the most beautiful bird one can picture;
fine style, alert, with graceful lines, hav-
ing a glossy green black plumage, yel-
low legs, white ear lobes, red face and
comb, in appearance always cleans. They
are hardy, quick to mature, vigorous,
busy, yet tame, stand confinement well,
great layers of large white eggs, lay
young and keep at it in any climate or
season of the year. Their meat is of
the finest texture. Briefly, they are a

city fowl and none better for the back lot or the farm for egg production or utility purposes.

Double Mating to Produce the Best.

However, understand me, they have their faults and breeding problems. Every bird hatched is not an exhibition bird. A small percent comes up to that requirement. The first thing to be considered in any class or variety is type, and type or shape should always be given careful consideration. Of late years the breeders of Black Leghorns, to a certain degree, have mastered the type and shape problem.

The difficult problem yet to be solved is producing male birds having pure yellow legs and yellow skin free from light undercolor in hackle, saddle or tail, or a red feather or so in hackle or wing bows. It is being done, but the percent of such birds from a hatch is small.

One has but little trouble in producing a good yellow legged female; however, the tendency in both males and females is to run to dark colored shanks. I have learned from experience that by linebreeding and double mating a very large percent of both males and females can be produced that have fine yellow legs and good color in every section; and if you should happen to have a male bird that has a red feather or two in his plumage, remember that black and white are synonymous and breeders of the other black varieties have the same trouble; or, if your cocker happens to be a little light in hackle, tail or undercolor; if he is otherwise a grand specimen, do not discard him, for he may make your best breeder. Remember perfect birds are scarce and that the Barred Rock breeders have trouble of eliminating black feathers from that variety.

By all means, if you purchase eggs or buy birds you must take care of them. No chick will ever mature into a good bird if poorly fed and stunted. In other words, if you expect to raise good chicks see that they have proper attention and are not neglected at any time.

Judging Black Leghorns.

Just a word as to judging Single Comb Black Leghorns. Last year there was considerable discussion through the poultry press as to whether or not a Black Leghorn should have a dark or yellow leg, and whether or not a bird with a dark leg should be discarded for any purpose. It has been my experience that a dark legged bird possessing all the other good qualities, type and shape of the variety, should not be discarded; nor should it be eliminated from competition in the show room; for such a bird, if well bred, will no doubt produce yellow legged and otherwise fine specimens of the variety; in fact, I yet consider it necessary to use such a bird.

It has been my experience, in exhibiting the Black Leghorns, that but few of the judges selected to place the awards in this class have ever had any experience in breeding the variety, and for that reason, a majority of them court some set hobby when placing the ribbons. That is, one will decide largely on head-points, another on color of plumage, another on yellow legs, and so on; and of late it is the yellow legged bird that wins regardless of his shape or any other Standard quality. This should not be. It makes it very difficult for a breeder that knows the breed

The World's Favorite Standard Reliable Incubators and Brooders

FORTY YEARS manufacturing Incubators and Brooders shows that they must be of the very highest quality and successful. Such is the history of the Old Reliable Incubators and Brooders.

Standard Reliable Incubators

The Old Reliable will give the highest per cent of hatches in any kind of weather. The double heating system saves one third of the fuel; is self-regulating, has a perfect ventilating system; nursery beneath egg tray. All hot water machines have copper tanks.

We manufacture a full line of Poultry fixtures: Such as Coal Burning Brooders, Fountains, Coops, etc. Guaranteed, and if not as represented, Money back if returned by purchaser within 60 days from shipping date.

Send for free catalog and prices. Address:

and what he is breeding to prepare an entry for exhibition, not knowing the hobby of the judge. Also, it is misleading to a beginner as it may cause him to discard a fine bird and purchase one not up to the Standard in many other points which are and should be major considerations. In other words, the Standard should be followed. Understand I do not say this to criticise

judges or the system of judging for each is entitled to his own opinion; but for the purpose of impressing upon you that if you have a good bird, and know it, and he is not a winner, just smile; do not dispose of it; do not change your plans; go right along as though nothing had happened. If you do not know, learn from the other fellow that does know, and in the end you will win.

Value of Setting Hens.

Only hens of the heavier breeds set, and with the present high prices of poultry meat and lower prices for grain and eggs, the meat properties of the heavy breeds are receiving greater appreciation. In case it is desired to break hens from setting, put them in a separate run as soon as they become broody. Do not let them set several days and become persistent, and then get angry and abuse them.

Are Sex Detectors All Bunk?

A great many poultrymen, far and wide, are wondering if the sex testing devices will really do as claimed for them.

Last year I had considerable experience with one of them, and from my observations it was far from being the wonder claimed for it. Of course I wanted all pullets, like most poultrymen do, and bought a sex tester so as to be sure to get that kind. After the chicks hatched and grew up, I found I had just as many male birds as at any other hatch.

For me, this instrument would move any old way my mind dictated, that is, it would move across the egg in a straight line or around in a circle while testing the same egg. This instrument was supposed to tell the infertile eggs as well as the sex. It did not, however, prove so in my case.

While holding the tester in your hand you unconsciously move your hand, but so slight-

ly you cannot detect the movement. One-sixty-fourth of an inch movement of your hand will cause the lower end of the tester to move at least an inch or more back and forth across the egg, while the very slightest circular movement of your hand will send it around in a circle.

Tie a ten-penny nail, a pointed piece of wood and a marble to an eight-inch length of thread, and holding it up, it will do the same thing as the egg testers.

To put these instruments to a real test, make a box nine or ten inches deep; make it solid, leaving one side open; bore an inch hole in the top, drop the tester through this hole and let your fingers that hold the thread rest solidly against the hole so they can not move, and I'll bet dollars to doughnuts the egg tester will not move if you put all the fertile eggs in the land under it.

Why doesn't the tester move when you fasten the thread to a stationary board and an egg is placed under it? I suppose the answer is, it is the electricity in your body.

Electricity is not going to run down that dry cotton thread when you hold it in your hand any more than if it was tied to a nail.

Now for these seers of eggdom. If these testers will do as the inventors, so-called, claim for them, why not have them tested officially at our agricultural colleges? Why not send one to Professor Dryden and let him tinker with it?

I have studied twenty poultry books during the last two years: none of them mention the method of telling the sex of eggs before hatching. Professor Quisenberry in his poultry course, states: "The devices for telling the sex of eggs are all fakes."

If these instruments were the real thing they would be worth, not \$2 or \$5, but \$50 to any poultryman. No, my friends, I do not believe nature intended these things to be known in advance. I have had three different kinds of egg sex testers, and in my opinion the instruments on the market today designed to tell the sex of eggs are all bunk. California. Frank G. Christensen.

Conkey's

The Original

(47)

Buttermilk Starting Feed For Little Chicks

1. Conkey's will prevent your big losses of little chicks, due to weakness and disease.
2. Conkey's will give your chicks that quick start in growth that is necessary to insure early broilers and layers.
3. Conkey's will help prevent White Diarrhea, as the lactic acid in the buttermilk helps sweep away and neutralize the germs that cause it.
4. Conkey's is low in fibre and just right in protein, scientifically correct. Does not injure or overtax the sensitive digestive apparatus.
5. Conkey's is the only Buttermilk Starting Feed made by the Original Conkey Process, in which the buttermilk is thoroughly incorporated with the other ingredients. No dried buttermilk ever used.

"Nothing Equals Conkey's"

U. R. Fishel, the well-known breeder of White Plymouth Rocks at Fishelton Farms, Hope, Ind., writes: "Conkey's Buttermilk Starting Feed is the best feed for young chicks. I have found nothing to equal it in the forty years I have been in business."

Conkey's Buttermilk Growing Mash builds bone and develops muscle quickly. Speeds up your fowls after they are 8 weeks old.

Conkey's Buttermilk Laying Mash gets more eggs without ruinous artificial stimulation. One of the three Conkey Buttermilk Feeds every poultryman needs.

Don't break the Conkey Chain—for best results feed all three Conkey Buttermilk Feeds.

THE UNDERCOLOR QUESTION.

By REV. T. W. HARWOOD.

For every variety of fowl the American Standard specifies a specific color for the entire length of the feathers. This is true for the downy portion of the feather called undercolor as for the visible part which really makes the appearance of the bird. Readers naturally think that, for some occult reasons, Standard-makers held undercolor to be equally important with exposed color.

What is the relative importance of undercolor?

The Standard may be supposed to give it equal importance. Some breeders, and apparently a number of judges, make it of first importance.

The contention of this article is that in most varieties it should be subordinate, and in quite a number, it should not be prescribed by the Standard at all, but left to the breeders' discretion.

Three considerations enter into the undercolor question: utility. Where the market for dressed poultry, especially broilers, is the controlling factor, as is sometimes the case with raisers of white, buff and red birds, the dark pinfeather is undesirable.

Beauty. No doubt there are some fanciers whose aesthetic sense derives more satisfaction from colors and markings which open up when a bird is handled than from what they can see when it is "on the hoof." The show room rule against handling other folks' birds is hard on these men.

Breeding. There are some who accept surface color as the main objective, but think it is best attained with a certain undercolor, therefore they insist on that undercolor, sometimes against evidence to the contrary.

With White and Buff varieties it is beyond question that, for all three of the above reasons, undercolor corresponding with the surface color is the thing desired.

In the breeding of R. I. Reds there seems to be some conflict of aims and ideas. From the market view-point alone, all smut in undercolor, along with all black feathers, should be eliminated. The birds should be red throughout. But the fanciers want black tails and black in wing flights. Some of them use males with smoky undercolor to hold this black as well as the dark red surface color. This is a departure from the strict utility ideal.

Never having been a breeder of Reds, the writer may perhaps illustrate his undercolor thesis from that breed as well as any, incidentally giving the numerous devotees of this excellent fowl an idea of how things look to an outsider. Hundreds of people as yet uninitiated in the "secrets of expert exhibitors," but excellent material for future fanciers, pass along the R. I. Red aisles in the winter shows, sizing up the birds according to their own ideas and asking questions of the more experienced onlookers. Here is a cockerel of great size, fine type and even color; just such a bird as the visitor wants to buy, but he is unplaced. Further along is the blue ribbon bird, two pounds less in weight, narrow of back and in general a far less imposing bird. This puzzles the visitor.

He plies those around with questions and learns that the judge found a few smoky feathers in the back of the unplaced bird. If he pursues his investi-

gation, he may find that the whole exhibit of Reds has been judged by undercolor. Sometimes he speaks his mind and says: "poultry judging is all bunk." More often he is mystified and dismisses the subject from his mind.

If R. I. Red breeders like that sort of thing, that is their affair. The popularity of their breed may be established beyond injury, but it is just possible that the wide discrepancy between the immense number of Reds raised and the size of the classes may be in part explained by this kind of judging.

Nor is it altogether fair to lay all blame on the judges. Their decisions not infrequently reflect the mind of the fanciers, many of whom indorse this undercolor judging. Some of them gloat over undercolor more than over all the visible beauty of their birds, just as Barred Rock men enthuse over bars that go down to the hidden part of the feather more than over those that are seen.

But the Barred Rock man has the better reason. Bars that go clear down indicate that barring is incurably bred into the bird just as lacing that goes all around the feather demonstrates the laced bird par excellence.

Undercolor, on the other hand, is more debatable. A Red Sussex is red with a slate undercolor, whereas a R. I. Red may be just as red without any slate. Other varieties show the desired surface color with varying undershades.

Breeders of black and paricolored fowl have to accept the dark pin feather and forego the perfect appearing broiler. When grown and in full feather this disadvantage disappears. And if the fancier eats his own broilers he can console himself with the knowledge that a black pin feather is as nutritious as a white one and that he who eats a white broiler is eating pin feathers, though he does not notice them. There will always be a number of people so enamored of beauty in form of bars, lacings, pencilings, spangles and rich green black as to waive the pin feather question. But in some of these varieties there is the same unreasoning craze for undercolor and color of concealed feathers which sacrifices the type and visible plumage where beauty is the most important. And the judge aids and abets their conspiracy against common sense.

Making a Fad of Undercolor.

Why is it that one sees ribbons in the Columbia classes awarded to females with gray in their backs, while specimens that look like the pictures are passed by? Of course it is undercolor and wing flights. Visible beauty is scarified for hidden shades and markings. If you question the judge, he will grab the bird out of the coop, show you the primaries and undercolor and, with a look of pity for your ignorance, say: "Don't you know that you can never hold the black in these birds without dark slate undercolor?" Perhaps so; but we think undercolor that shows out on the back makes a whole lot worse looking bird than if it stays under, or even some white in those precious wing-flights. Regard for beauty would suggest that the birds with perfect outside color be first selected. If, in choosing between them, those that excel in concealed characters are given preference there is less ground for objection.

Insistence by the judge on a certain undercolor because of his honest opinion of its breeding value is hardly fair

Certain Results

There is no doubt about the sanitation you get and the better profit you obtain from your flock when you use Carbola. There is no doubt, either, about the extra and unnecessary work the use of Carbola saves you. It's a short cut to the best results, a time and money-saving method of painting and disinfecting that is so decided an improvement in every way over the old whitewash-and-disinfectants method that no poultry owner, once he has used Carbola, will do without it.

comes to you in handy powder form. Right in the paint powder is a germicide twenty times stronger than pure carbolic acid. In one operation you get not only snow-white walls, but also a thorough disinfection that helps prevent the start and spread of diseases that affect poultry, cows, hogs, horses, or other livestock, and that also destroys mites, lice, etc., and keeps these profit destroyers from developing in the living quarters of your animals.

Less than five minutes is all that is needed to mix Carbola. You simply stir the powder in water. No straining or waiting. The smooth liquid paint-and-disinfectant resulting will not clog a sprayer as whitewash does. It stays on the wall—does not peel or flake off as whitewash does. The disinfectant grows even stronger as the paint dries, giving your livestock a constant, day and night guard. And you can mix it and leave it standing if you wish—it will not spoil.

Use It Instead of Whitewash and Disinfectants

Apply with brush or sprayer to wood, stone, brick, cement, plasterboard, tar paper or other surface, or over whitewash. A gallon (a pound of the powder) covers 200 square feet. A powerful germicide, but harmless to the smallest chick or to stock that licks a painted surface.

AS A LOUSE POWDER—Many poultry keepers, dairymen and hog raisers use the dry Carbola powder as a louse powder because it is so very effective in destroying lice and costs only a third as much as other brands. Use it as you would any other louse powder.

Carbola is used on thousands of farms, large and small, and by leading agricultural colleges and experiment stations, and is highly praised by sanitation experts.

Your hardware, drug, paint or seed dealer has Carbola or can get it. If not, order direct. Prompt shipment by parcel post or express.

A guide to success in this, the most difficult poultry problem

Know How to Turn Loss Into Profit

The results of many years of practical experience and study. Written by Prince T. Woods, a man who knows how and who can teach others. This book will save many dollars for any poultryman and is indispensable to the beginner.

Read These Chapter Titles Over

Chapter I—Selecting and Mating Breeding Stock. Chapter II—Food, Vegetable, Animal and Mineral. Chapter III—Fowls and Food. Chapter IV—Care and Management of Breeders. Chapter V—Eggs for Hatching. Chapter VI—Incubation, Natural and Artificial. Chapter VII—Brooding with Hens and with Brooders. Chapter VIII—Chick Foods and Feeding Chicks. Chapter IX—Growing Chicks. Chapter X—Facts About White Diarrhea. What white diarrhea is. Symptoms of disease. Causes. Is there more than one form? Has germ of specific disease been found? Infection. Prevention. Treatment. Formula for a simple remedy which has proved effective in many cases in many climates for years.

Don't go through years of costly and discouraging experiments to learn the facts taught in this book. One chick saved will pay for it. Learn how to feed; to prevent disease; to make your own brooders, and feed for your chicks. 75c postpaid.

American Poultry Journal, 523 Plymouth Court, Chicago, Ill.

to the breeder. Strictly speaking, it is not the judge's business to select the best breeding birds, but those conforming to the Standard. The really best undercolor, that should be associated with the Standard markings, is sometimes the matter that the breeder is working to ascertain.

By prematurely prescribing that undercolor the Standard unnecessarily limits his freedom of experiment. Dark slate undercolor in Dark Brahma and Silver Pencilled males was required by the judges' interpretation of the Standard long after breeders had found it incompatible with Standard surface color in both males and females.

Undercolor Is the Breeder's, Not the Judge's Problem.

This raises the question with which this article must close, and which the writer would commend to the thoughtful consideration of honest fanciers. Why need the Standard prescribe undercolor in pencilled, laced and spangled varieties at all? Why should the judges be troubled with it? This question applies only to undercolor, not to markings on concealed feathers, which the writer thinks the Standard should specify while instructing judges to give them secondary importance.

What harm would come of leaving undercolor in the above mentioned varieties entirely to the breeder's discretion? Let him produce really beautiful birds with any undercolor that he finds will turn the trick.

If this were done, the show room awards would be far more satisfactory to the eye of the observer and would give the judge a more pleasant job. Possibly he would have less opportunity to astonish novices with a display of his skill in detecting concealed defects. But then, are we producing beautiful plumage for pleasure and art, or simply to flatter the vanity of judges?

High Temperatures That Did Not Kill Hatching Eggs.

In the March Journal, in the article "The Eggs, the Stock, the Incubator," I find this statement by the author, T. S. Townsley, on page 302:

"In many cases the lamp goes out some time during the hatch, and allows the eggs to become thoroughly cold, or, again, the lamp may smoke up and send the temperature up to 106, 107 or even to 110 degrees, which is bound to kill the germs that were not the strongest, even if no other influence affected the result."

In this connection I watched with great interest a series of experiments conducted by W. F. Fechner, one of the foremost Texas poultry experts, who devotes more time to production of poultry than to writing poultry theory. These experiments establish in my mind the absolutely inaccuracy of the quoted statement. Mr. Fechner, waiving theory and taking into consideration the fact that eggs hatch in tropical climates where the temperature of the atmosphere itself frequently exceeds 105 degrees, demonstrated practically that an 85 percent hatch can be secured with the incubator temperature held continuously above 110 degrees throughout the hatch, provided sufficient ventilation is furnished. In his experiments he used a steam heated mammoth machine, boring numerous extra ventilation holes in the bottom to provide an extraordinary supply of fresh air to eggs hatched in compartments in some of which the temperature ran as high as 120 degrees.

I am aware that there is a dogmatic theory accepted generally among poultry fanciers that a temperature a little over the usual 103 is fatal to embryonic chicks, but my experience and observation is that many thousand more chicks are killed annually during the hatch through lack of sufficient ventilation in the incubator than through excessive heat.

Julian Capers, Jr.

Texas.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I am a young man twenty years old. My ambition is to become an owner of a small farm of about sixty acres. I wish to make it a poultry, fruit and truck farm; also an apiary. I have a great liking for poultry and bees.

I have held a position as foreman of an experimental plant at one of the agricultural experiment stations. I will be occupied at least one year at a position paying a very limited wage.

My plan is this: I would like to take up a position at some agricultural experiment station to get enough experience to be able to take a position as foreman on some big poultry plant that would enable me to save enough money to purchase a farm. I have a graded school education.

Do you think a correspondence course in poultry husbandry would make me fit to take up a position as foreman, etc., on some poultry plant specializing in several varieties of poultry? Do you think I could save enough money in ten years to pay for a farm like that and purchase all necessary for it? Do you think practical a farm like I have in mind? Give me some advice you think will be helpful to me. Would you please tell me just what you would do if you were in my place? Daniel Kazmerchak, Wisconsin.

I have read this letter several times. The appeal made therein comes from this boy's heart. I wish I had the power to show him a short cut to possession of his ideal farm. But this I cannot do. There are no short cuts to possession of such a farm for the boy, who must acquire same by labor and saving. I am going to answer what I consider your most important question before taking up the matter in general. Yes, I do consider practical such a farm as you desire. It is the ideal combination.

I would advise you to secure a position on some large poultry farm. There you would get actual experience which would fit you to hold a position as foreman on a like farm. You could save a greater part of your wages. Then when securing higher wages as foreman you ought to soon save enough money to purchase your farm. You must bear in mind that it will be only through work and saving that you will ever succeed. I know you can do it

and that your dream will surely come true if you will just save, save.

* * *

I own 35 acres of good level land on which are good buildings, located in Rock Island county, Illinois. Good markets about thirty miles distant. Now, I do not believe the growing of grain only would be profitable on such small and high priced land, and, by the way, I still owe some on the place.

I would greatly appreciate your kindness if you would advise me how to stock this place so that I could do most of the work myself.

I think I should have about ten acres in alfalfa, a couple of good cows, and some land in corn. I would keep about 200 hens, and I would want large and small fruit, as much as you think I could manage.

Would gooseberries and currants be profitable? How much fruit and what varieties should I plant?

What I need is something that will bring in early profits.

E. Mauburg,

Illinois.

Any amount of fruit which will give considerable returns cannot be handled by one person. In picking time and spraying time, help must be employed. Therefore I advise you to plant enough fruit to make it a business proposition. I advise you to plant five acres of apples. Would plant Delicious, Grimes Golden, King David and Black Ben. These are all winter varieties. The fruit can be handled practically at the same time. This is a big item in cost saving. You will need two trees each of Duchess, Yellow Transparent and Wealthy for home use.

Currants and gooseberries are very profitable. Plant an acre each of Red Cross and Fay currants and Oregon Champion gooseberry.

Would plant one acre of grapes, choosing an equal number of Concord and Worden.

An asparagus bed of, say, one-half acre would be very profitable.

* * *

I bought ten acres, well improved, about sixteen miles west of Chicago. There is a nice young orchard (bearing about three years) of about 115 trees, of which 112 are apples, from the Yellow Transparent to the Grimes Golden, a number of varieties ripening in succession; but no Delicious. There

Crystal AUTOMATIC DRINKING FOUNTAIN

HOW TO RAISE BABY CHICKS

Put Avicol in the drinking water

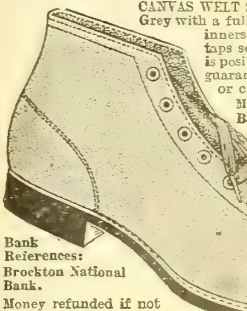

Most people lose half of every hatch, and seem to expect it. Chick cholera or white diarrhoea is the trouble. The U. S. Government states that over half the chicks hatched die from this cause.

An Avicol tablet in the drinking water will save your chicks from all such diseases. Within 48 hours the sick ones will be lively as crickets.

Mrs. Wm. May, Rego, Ind., writes: "I was losing 10 or 15 chicks a day from diarrhoea before I received the Avicol. I haven't lost a one since."

It costs nothing to try Avicol. If you don't find that it prevents and controls white diarrhoea, chick cholera and all bowel diseases of poultry, tell us and your money will be promptly refunded. Avicol is sold by most druggists and poultry remedy dealers, or send 52c (includes war tax) for a package by mail postpaid. Burrell-Dugger Co., 200 Columbia Bldg., Indianapolis, Ind.

A NEW STEAM-COOKED FEED

H-O STEAM-COOKED GROWING MASH

BECAUSE H-O STEAM-COOKED CHICK FEED is cooked by steam for more than two hours, poultrymen can bring their chicks safely through the critical first weeks.

This wonderful steam-cooking process is now also being used in the manufacture of a new feed, *H-O Steam-Cooked Growing Mash*.

When the chicks are somewhat mature, a supplementary feed, in addition to H-O STEAM-COOKED CHICK FEED becomes necessary. *H-O Steam-Cooked Growing Mash* is designed to meet this need. Poultry raisers will welcome this new steam-cooked feed because wonderful results are sure to follow its use.

To be certain that your chicks will live and develop rapidly into profitable poultry and prize birds, feed the H-O combination: First, H-O STEAM-COOKED CHICK FEED; as soon as the little chicks show that they are thrifty and beginning to grow, add *H-O Steam-Cooked Growing Mash*, continuing with this combination of H-O STEAM-COOKED CHICK FEED and *H-O Steam-Cooked Growing Mash* until the sixth or eighth week; then continue feeding *H-O Steam-Cooked Growing Mash* and add H-O SCRATCHING FEED.

Get a supply from your dealer today. If he cannot supply you, write us.

Samples of these feeds and literature free on request

What's a CAPON and Why?

A book that explains everything you will ever want to know about CAPONS. 50 pictures from life that show each step in the operation. List of Capon Dealers' addresses. Tells how to prevent "Slips" where to get the best and cheapest capon tools. Capons are immense eating. Big profits realized. Get wise. This book tells how. Copyrighted new and revised edition. Regular 50c copy, prepaid to your address (a short time only) for a Dime in coin or stamps. **GEORGE BEUOY, R. R. No. 7, CEDAR VALE, KANS.**

are three pear trees, two Kieffer and one Bartlett. There are about twelve trees missing in various rows, and I thought of filling in with Delicious and Golden Delicious.

Now, I want to plant some cherries, peaches, a few plums—about 100 trees, all told. I also want to finish the pear row (ten trees) with pears, and want to put in a grape arbor, blackberries, currants, red raspberries, gooseberries and strawberries. But I would like to arrange all fruit so it would ripen in succession, not all at once. For instance, peaches from early to late; cherries also, and so on.

We have about 200 chickens, also a few ducks, geese and turkeys, and feel that with the fruit and poultry combined, with a good market for everything close at hand, we can make a living. Would also like a few bees.

I do not know much about pruning and spraying. Where can I get this information? And what journals are most instructive?

Please let me know what kind of fruit is best suited for this climate. T. J. Scherve, Illinois.

I would make the transplants in the orchard all Delicious trees.

Would plant the cherries to two-thirds Montmorency and one-third Early Richmond.

Peaches you will find very unsatisfactory. I think it unwise to plant peach trees in your section. It means disappointment for you if you attempt to grow peach trees.

The best plums for you to plant are Terry, Surprise, Omaha and Wyant.

Would make the grape planting largely Concord and Worden. Would plant a few each of Moore's Early, Diamond, Niagara and Lucile.

You will find the Red Cross and the Fay currants the most profitable.

The Oregon Champion gooseberry is worth all others combined.

Would advise you to plant Royal Purple, Cumberland and Black Pearl raspberries.

Plant Dr. Burrell, Haveland, Sample and Gibson strawberries.

Be sure to have as many bees as you can care for. * * *

Can you please inform us where we may secure information concerning the homestead land referred to in the December American Poultry Journal, by P. F. Foley; located in California, or any other good government land? W. K. Danby, Illinois.

Write the Department of Agriculture, Washington, D. C. * * *

Will you advise if there is anything that will make my pecan trees bear. They were set fifteen years ago. I am located in the hilly part of Yazoo county, Mississippi. These trees are the paper shell variety. They are set along a stream under the hills, and there is quite a lot of other timber near them, Mississippi. J. R. Jones.

Without knowing more about the trees and the nature of the soil, etc., I cannot advise you. My idea is that the trees are making too rapid a wood growth. It may be that these trees are seedlings. If so, they will come into bearing very late, as is so often the case with seedling pecans. Consult your state horticulturist. * * *

I have bought 24 acres of sandy post oak land in Milam county, central Texas, sixty miles northeast of Austin and about the same distance southeast of Waco. Twelve acres are in cultivation, twelve are in timber, mostly post oak and blackjack. I am going to move onto this little place right away and do my best to convert it into a pleasant as well as profitable little home. I have derived much benefit and knowledge from your kindly advice to others, so will be greatly pleased if you will help me out a little in my venture.

I gradually want to make of this place a fruit and truck farm and arrange finally to carry 500 hens. I say gradually, for my means are very limited, so of necessity I will have to go slow. I am going to clear the balance of the land as quickly as I can.

I am located about equidistant from Dallas, Fort Worth, Houston and San Antonio, ap-

999 QUESTIONS AND ANSWERS

124 pages. No matter what question arises, this book gives the answer in a few words. Questions for the fancier about feeding, correct rearing of chicks, what and how to build, disease, incubation, breeding turkeys, ducks, geese, etc. Paper, 50c cloth, 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

proximately 140 miles, with Austin and Waco closer. Now, what I want is your opinion of these cities as a poultry and egg market at this distance? I am within three miles of a good shipping point, with two trunk line railroads. I have now 100 Brown Leghorn pullets that are purebred and which I think are very fine.

Would you advise building my 500-hen flock from the Browns I now have, by the use of pedigreed males, or change to the White Leghorn, which seems to be the preferred fowl for egg farming. Please state what you think about this, as I am somewhat at a loss to know which would be best, and do not want to start wrong. My idea is to devote four acres to the 500 layers, cut into eight lots of one-half acre each, with houses in the center of each acre, so that I can grow greens in half the lots all the time. Kindly suggest improvements on my plans.

Now as to fruit. Wild dewberries and blackberries are growing fine on this land. Peaches, pears and plums do well in this section. Grapes of several varieties grow wild.

Please tell me what peaches and grapes you would plant for home supply and some to market? Do you think I could grow cherries? If so, what varieties? And what plums? Do you think I could grow loganberries in Texas? If not, why not?

The altitude here is 700 feet; rainfall, 30 inches, average. Land light sandy and fresh. Natural berry and sweet potato land. Texas. N. J. Green.

You certainly are favorably located so far as market advantages are concerned. The cities you are near are splendid markets. It looks to me as though you ought to make a big success of this combined fruit, poultry and truck farm.

I most certainly would advise you to build up your 500-hen flock of layers from your present stock of Brown Leghorns rather than to dispose of them and buy White Leghorns. The Browns are the equal of the Whites in every way.

It is evident that your soil is one favorable to the production of the berry fruits, as wild berry bushes are growing there. I would plant quite liberally of raspberries, blackberries and dewberries. For market you will find the Concord and Worden grapes the most profitable. Do not be carried away by any of the so-called fancy grapes. I do not think you will find it profitable to attempt to grow cherries, unless your state college or some grower in your state has developed a cherry to suit your peculiar climate. Consult your state college authorities. Would plant Wyant, Surprise, Omaha and American plums.

You certainly ought to grow loganberries profitably.

* * *

What are the chances of successfully producing the Professor Hansen plums and cherries in our northern Ohio climate? If you think I should be able to grow them here, may I ask what you would advise planting, and where can I secure these trees? Ohio. L. W. Cline.

These hybrid plums will do nicely in your location. Plant the Sapa, Opata and Waneta. The Gurney Nursery Co., Yankton, S. D., introduced this race of plums.

* * *

I first started to read your department much in the manner of a student conning the remarks of a master. Now, however, I feel it my turn to seek advice of you.

For some time I have noticed that you particularly recommend western North Carolina; as in your reply to D. P. Sanford and, in the last number, to C. W. Beck.

Now, I find myself in the following position: Twenty-eight years of age, married, with a baby daughter of seventeen months; university education, and to date have followed banking, with the exception of three years in which I taught Greek and mathematics in a western university. Was reared on a farm where we raised Standardbred poultry and thoroughbred stock. Have at present about \$15,000 dollars and, like the rest of your correspondents, am trying to rear my castle in Spain, that is, to find the

I. R. Mankel Upper Sandusky, O.

ideal location where I can follow general farming, raise a family supply of fruit, keep a few thoroughbred cows and a nice flock of poultry.

I believe from what you have said that western North Carolina is the proper place. May I not, therefore, ask you to help me in settling this question and, in endeavoring to come to a conclusion, put a few questions to you concerning that section?

Are the negroes rather numerous in that section of the state, that is, so numerous as to make the locality undesirable from a northerner's viewpoint? This matter of negroes is, in my opinion, the one invulnerable drawback to southern sections. I noticed that you answered one of your correspondents to the effect that North Carolina was "not too far south for a northern man," but I could not be sure of my interpretation of the meaning intended in that statement—whether it referred to the negroes or to the climate.

What is the cost per acre of a well improved farm lying fairly close to a town in that section?

Is there any cheap land suitable for grazing purposes more remote from the towns, so that one could own his farm close in and have a range farther back in which to graze his yearlings and stockers? If so, what does such land cost?

James H. Macauley.

The negro is not as numerous in western North Carolina as in Mississippi and other southern states. Do not let the presence of the negro defer you from moving south. The negro is absolutely essential to the prosperity and wellbeing of the south. There is no "negro question" down there. That is the talk of northern folks who do not understand the situation. All southern people of means and good sense realize that the negro is an asset and not a liability to the south.

Good farming land can be bought for \$100 to \$150 an acre. Good fruit land can be bought for less money.

Yes; such land can be bought for \$10 to \$50 an acre.

I am sure you would like this "Land

of the Sky." It is one of the finest sections of all the United States. The climate is delightful, the land fertile, the scenery grand, the water the purest in all the country, and the people the best in the world.

* * *

I own a farm of 65 acres, nearly all tillable. I am convinced that a farm of this size is best run as you advise—diversified. My intention is to start with everything thoroughbred: two registered Guernsey cattle; registered mare, either Percheron or Suffolk; Duroc sow; White Leghorns and Reds, and keep just what I can handle myself. I want to plant apples, pears, cherries, plums, and some peaches if practical, besides small fruits for home use and market the surplus.

I would like to have you suggest what fruit trees and about how many. On the place there is an orchard of about thirty trees, mostly Baldwin and King apples. My farm is located ten miles from Scranton (150,000 population and good markets) and about sixty miles from Binghamton, N. Y. The land slopes to the east, and to the west a large creek, the outlet of a lake, runs through the center.

T. M. Reese.

Pennsylvania.

The Stayman Winesap apple is especially adapted to your soil and climate. Plant two-thirds of your orchard to this variety, using Delicious and Golden Delicious for the rest of the planting.

Advise you to plant the Lincoln pear largely; also Garber and Keiffer. Make your cherry planting of Montmorency. In plums would advise Omaha, Terry and Surprise. You will find the Early Elberta, Elberta, J. H. Hale and Krummel peaches to your liking.

* * *

Will you advise me as to running a chicken ranch of about five acres near Phoenix, Ariz.? How are the markets of Phoenix and how does the supply compare with the demand? Would have some garden and from two to three cows in connection with the chickens.

Iowa.

Mrs. G. H. Bughols.

POULTRY ALMANAC FOR 1921

It is a textbook of information. Tells about and shows pictures of the different varieties, incubators, brooders, poultry ills and how to cure them, what and how to feed, how to build poultry houses, etc. Write for it today, inclosing 20 cents.

Phoenix is a good market for poultry and eggs and dairy products, especially in the winter time, when there are thousands of tourists in the city. The supply of home grown eggs and poultry is not equal to the demand.

* * *

We have read with much interest your advice to the many undecided people, and come to you now for information regarding New York land.

We are renters in Muscatine county, Iowa, giving half the grain and paying cash \$12 an acre for pasture and hay land, and farm over 200 acres, or rent that, with the help of our two boys. With prices the way they are it makes renting a problem. "To rent or not to rent?"

My husband and I are not young, and we want a home of our own and feel we can never own one here in our native state, land prices not seeming to come down with crops.

Last fall we wrote to the E. A. Strout Farm Agency, New York, and have received circulars from almost every county in the state. Of course we make a lot of allowance for some of the land descriptions, but thought there might be a bargain in some. We were impressed with the central part, around Auburn and some other cities.

We would have six or eight thousand dollars to invest, but do not want an abandoned farm. Would like for myself and husband to care for poultry and dairy while the boys do the heavy farming. We are great lovers of poultry and have had fine success. Would like a location where small fruit does well. Would not think of buying until we looked well over the land and found out about farming conditions.

Is the land anything like central Wisconsin, or climate similar? We lived for five years on a cut-over farm there, and found the feeding season too long and growing season too short to make a success. Will be glad for any advice.

L. D. M.

Iowa.

I am sure that you will find just such a farm as you desire if you will make a personal inspection of the state of New York. There are wonderful farms there for sale. Do not expect to get a

good farm for nearly nothing; but one can buy a good farm there cheap. No; the condition is not at all like that in central Wisconsin.

I feel sure you would be well satisfied to live in New York. It is indeed the Empire State of the Union. Good markets are on every hand. I advise anyone wishing to buy a farm to make a trip of inspection to New York. The country around Auburn is fine.

* * *

I am considering purchasing a 40-acre farm in Northern Indiana, Starke County, near Knox, Ind., or one in Pulaski County, Indiana, near Winamac, Ind., for poultry, fruit and dairy farming, about 73 miles southeast of Chicago, Ill.

Is this a good location for poultry farm, and right soil and climate for apple orchard?

What kind of apple trees are best to plant in above location? Soil is sandy loam, ditched and tiled.

A. W. Gladwin.

Either of these locations is all right for your purposes. Would plant Grimes Golden, Stayman and Delicious apple trees.

* * *

I have a farm near Leslie, Mo. It is hilly and rocky and has hardpan. Please advise me what kind of fruit trees would be best to plant in this soil. Please state kind of apples, peaches, pears, plums, cherry, grapes and berries you would plant in this place. I could put 40 acres or more in fruit trees and poultry. Would it be necessary to dig through the hardpan, or how deep should the soil be above the hardpan to be good if it would be good at all for fruit?

Missouri.

John C. Bossert.

It will be necessary to break up the hardpan so the tree roots can find room for growth. This can be done by the use of dynamite. Whether it will pay to plant a commercial orchard on this land depends on the kind of soil below

WHITE DIARRHEA

A PERFECT HATCH! THEN WHAT?

Will you save every chick, or shall WHITE DIARRHEA get them? This contagious germ disease causes greater loss than all other poultry diseases combined. In infected flock the loss varies from 50 to 80 per cent of the chicks hatched. Chicks that recover often remain stunted all their lives. Stop this enormous loss. Raise every chick you hatch. No need to lose a single one. Raise them all. Keep them healthy and strong and growing fast.

"Giles" POULTRY-TONE is a safe and effective germicide for all bowel germ diseases. It combats the germs that cause white diarrhea and it tones up the system so the chicks can resist disease.

"Giles" POULTRY-TONE positively prevents White Diarrhea. For Chicks already affected, it affords prompt and permanent relief.

50c a bottle; quart can, equals ten 50c bottles—\$2.50. Prepaid. Satisfaction guaranteed or money refunded. The season is here. Be prepared. Act now. Order today.

REGAL DORCAS EGGS—HALF PRICE

Regal X First Pen Cock, Boston, 1918

JOHN S. MARTIN

More Regal Dorcas Prize-Winning Cockerels are hatched in May than in any other month of the year

"Why?" Because these Regal Dorcas White Wyandotte cockerels are so vigorous, so thrifty, and make such remarkable growth that many of them are fully matured in six months.

At the Heart of America Show, Thanksgiving Week, I showed twelve cockerels in the single class and three in young pen class, all of my own breeding. Five of these cockerels were hatched in March and April, ten of them in May.

As the season is so advanced I have decided to reduce egg prices earlier than usual. You can now get eggs from the same identical birds that produced these marvelous prize winners last season for half price.

After May 10th, All Egg Prices Will Be Cut in Two

Pens 1-10 (Exhibition matings)—\$5.00 per 15, \$15.00 per 50, \$25.00 per 100. Pens 11-20—\$3.00 per 15, \$9.00 per 50, \$17.00 per 100. Pens 21-40 (Dorcas)—\$2.50 per 15, \$7.50 per 50, \$13.50 per 100. Pens 25-32 (Special Dorcas)—\$5.00 per 15, \$15.00 per 50, \$25.00 per 100. All-Star Matings—\$10.00 and \$12.50 per 15. Utility Matings—\$7.50 per 100. Special Utility Matings—\$10.00 per 100.

All eggs guaranteed 75 percent or over strongly fertilized. These remarkably low prices will make a very heavy demand for the balance of the season. Rush your order direct from this ad, and produce some of American's Finest White Wyandottes.

TRADE MARK AEM THERMOMETERS NEVER VARY

You cannot afford to risk using any other thermometer in incubators or brooders. Insist on "A. E. M." At dealers or direct. A. E. MOELLER, 261-3 Sumpter St., Brooklyn, N. Y.

the hardpan. There should be two feet of good soil above the hardpan.

The Black Ben, Grimes Golden, King David and Delicious will give you big profits if your land is fitted for orchard.

Pears: Lincoln, Keiffer, Seckel and Bartlett.

Peaches: Early Elberta, J. H. Hale, Alton, Capt. Ede, Krummel.

Plums: America, Omaha, Terry and Surprise.

Cherries: Montmorency and Suda Hardy.

Grapes: Worden and Concord.

Currants: Red Cross and Fay.

Gosseberry: Oregon Champion.

Raspberries: Cuthbert, Royal Purple and Cumberland.

Strawberries: Haveland, Dunlap, Gibson and Sample.

* * *

Could you give me any information regarding the land along Black river around Newport, Jackson county, Arkansas? Would it be advisable to buy land there to start raising poultry, as I would like to start in the poultry and egg business, or is the land swampy or mountainous?

Indiana. Mrs. Edith Holland.

The land you mention is very hilly; the river bottom is fertile. I certainly would not select that location in which to establish a market poultry plant. Too far from best markets.

* * *

I am located in Oconto County, Wisconsin, and would like to know how many strawberry plants it takes to the acre, and what distance they should be planted apart. Also what would be the best plants to grow in the line of ever-bearing, as I prefer the Dunlap mostly. Wm. E. Nelson.

Set plants one foot apart, with rows three feet apart. This will require 14,520 plants to the acre. I advise planting Dunlap, Haveland, Sample and Gibson.

Raising Chicks.

We are past the half-century mark. Born and lived all our lives in a city. Last spring decided to raise some chickens. Bought fifty, day-old chicks, White Leghorns. Raised 49, of which 23 were roosters, leaving 26 pullets. Developed them so we had a good laying record during the cold winter months. Our March record is 590 eggs. We observe this is a much higher record than the average of the first five international egg laying contests held under the direction of the Connecticut Agricultural College, showing the egg yield for the month of March to have been 18 eggs per pullet. Our yield is fractionally within 2 3/4 per pullet. And neither of us (wife and I) had had any sort of experience whatsoever with chickens, except to eat them at the table. We have never had a sick chicken. Done nothing for them except keep them in a good, dry, clean place and feed and water them. They demand only a few minutes three times a day. Have only been let out of the coop a few times (we have no run), our March weather having been very bad, snow and rain, and besides we have a flower garden planted to bulbs which we could not let them destroy.

We would like to have this record compared with others under similar circumstances. Utah. C. A. Smurthwaite.

Practical Sanitary Measures.

The best sanitary measures are sunshine, fresh air, clean water, good feed, freedom from dust, and frequent disinfecting. In the spring and fall go through all the houses and spray them inside with whitewash and disinfectant.

Milk, skim milk or buttermilk are among the best muscle and bone builders for growing chicks. The growing birds thrive when given plenty of skim milk from a separator or buttermilk from a churn. They need no other form of animal protein when milk is provided. The birds should also have plenty of fresh, clean water. They can drink the milk, or it can be mixed with a mash.

Fanciers who wish to grow big bodies and not big combs, and those who desire to grow wealth of plumage, put their dependence in milk.

WHITE DIARRHEA

Don't Lose a Single Chick This Season

Don't let White Diarrhea "get" a single one. Raise every chick you hatch. You can absolutely prevent and cure White Diarrhea if you use

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

POSSIBILITIES OF THE JUNE HATCHED CHICK.

First Prize Article.

The hatching season brings up the question of the relative values of early and late-hatched pullets. By common consent we believe most poultry men have heretofore given the decision in favor of the early bird. So did we. But something in our own experience last season has raised a doubt and led us to think that this is rather an off-hand decision, well enough supported by plausible reasons, but none too well by facts. Moreover, we have been somewhat disillusioned by the fact that some of our early hatches have defaulted, and when the time came to open the winter egg campaign have started to moult instead, and thus the best part of the season was spent in loafing before an egg was laid. We are not so sure now that the early pullet is necessarily the most dependable layer even in winter, and we may have to modify our former views respecting her.

As usual we set our incubators in order early for the season of 1920. A number of satisfactory hatches were taken off before the season was

too far advanced. Late in April the incubators were dismantled for the season. One, however—the smallest—was kept in commission for a little experimenting, and also to bring off a later hatch to provide table fowls for the holiday season. Accordingly in June a scrubby looking but lively bunch of youngsters made their appearance. Their treatment was the same as that given to the earlier broods. Otherwise no particular attention was paid to them. They were allowed their liberty when old enough and foraged as they pleased, but were fed regularly.

In August we noted that these chicks were rounding out handsomely. A month later they were gaining rapidly on their earlier cousins, and we began to consider whether it would be wise to send them to pot. A pen of the most promising pullets was reserved for observation and comparison.

Now, listen: In the latter part of November this pen of ten belated Leghorn pullets began their laying season by dropping two eggs as a starter, when they were just five months from the shell. Several of the regular Leghorn and Wyandotte pens got under way a week or two

Ready Built Houses for Less Money

Standard of Perfection

Since 1874 the American Poultry Association has issued many editions of the Standard.

It is the guide of all breeders of Standardbred fowl.

It is the one authoritative law recognized and enforced by licensed poultry judges in awarding prizes in the poultry shows of the United States and Canada.

This book contains the complete Standard for every variety of land and water fowl that has been recognized as a Standard breed, giving the official Standard requirements in every section. It gives the correct weight, shape, color and feathering markings of every variety.

Three hundred and sixty-eight pages, bound in cloth. 112 full page illustrations of the ideal males and females. A complete list of all disqualifications.

No Poultry Breeder Should be Without a Copy

Buy a copy and know the Standard requirements for all American Standard-bred breeds and varieties. Price, cloth, \$2.50; sent postpaid.

AMERICAN POULTRY JOURNAL

523 Plymouth Court

Chicago, Ill.

earlier, but in the matter of percentage the March and April hatched pullets have never been in it with the June birds. A day or two after the latter laid their first pair of eggs this number went to four, then quickly to five, six and seven daily. From that time on that pen had a daily percentage running from fifty to ninety. Their average percentage for the season to date (February 1st) is well above sixty, and they are still going strong. For a June hatched scrub pen that is a performance worth while, isn't it?

There was no effort to force or coddle them. Their environment and treatment, as stated above, was the same as that given the other pens. Their feeding and housing were no different, except in one particular. The eggs from which they were hatched were not even selected, but taken at random from the general run of the laying pens, as it was not the purpose at that time to produce breeders, but table fowls. They were not at all considered as possible winter layers, much less as successful contenders for first place in the percentage column.

There must be a reason for this unusual, not to say phenomenal, performance. Perhaps we can place our finger on it. In the preceding paragraph it is noted that the care of the June chicks was the same as that given to all the others, except in one particular. That particular point of difference may furnish the key to the answer to this story. It is this:

The section of the brooder house to which these chicks were assigned was provided with a simple but effective hot water heating plant of home construction. During the entire summer when the days were damp and the nights a bit chilly they had access to artificial heat, and they still have it. Not much heat is used—just enough to supplement the natural heat of their bodies when the temperature goes down.

We incline to the belief that this may explain in part at least, their remarkable efficiency. If not, then we appeal to some of the elder statesmen of the poultry world, who have had a similar experience to enlighten us. We want to know just why June pullets should carry off the honors in a winter laying contest in their first year in competition with earlier birds of their own breed. Really it doesn't seem good form for the latecomers to behave that way.

Of course, it is well to remember that it takes "more than one swallow to make a summer." We do not purpose to abandon early hatching on the strength of this single experience; but we shall in the future take a keener interest in the behavior of the later ones.

Penna.

GEO. H. SUHRLE.

SOME INCUBATOR EXPERIENCES.

Second Prize Article.

Away back in the days when I first became interested in incubators it was not as easy as it is now to get a reliable machine. They were in an experimental stage some 25 years ago, and the inventors did the experimenting at the expense of the poultrymen. Buying an incubator in those days was like buying an automobile a few years ago. The promises held

out by the manufacturers were not always followed by performance.

I have owned a number of makes of incubators in my time—good, bad and indifferent, mostly indifferent. However, the same may be said of the average sitting hen. A biddy that sticks faithfully to her job until the hatch is finished is not as common as the advocates of the hen-hatched chick would have us believe. I have had many a promising hatch spoiled through the defection of a frivolous hen, who, with the perversity of her sex, would desert her maternal job just when so much depended upon her faithfulness and attention to duty.

The first incubator I bought was a second-hand machine. I have bought a number of used machines since then, and my advice to the man who is about to buy an incubator is to buy a new one. By following the manufacturer's directions you stand a better chance of good hatches than by investing in an old machine. Most of the used machines I bought did not have all the parts necessary to their successful operation. I considered myself something of an incubator expert in those earlier years, but the owners generally managed to slip one over on me. The machines were not in operation when I bought them.

Those early incubators were built more to stand hard knocks than to hatch eggs. I often thought the manufacturers built them strong in order to withstand the assaults which the irate owner was tempted to make on them with an ax. The first machine I ever owned was built in a small Delaware town, and weighed about twice what a 300-egg machine would weigh today. It held about 150 eggs. The walls were about four inches thick to keep out the cold, although it was hardly necessary in the comparatively mild climate of the Eastern Shore of Maryland. I suppose the maker realized his mistake later, for there were six or eight holes bored in the bottom to let the cold in.

I filled the machine and adjusted the various regulators according to directions, and all appeared to be going well until the end of the first week, when I discovered the machine to be leaking. I took it apart and found the tin tank—they did not use copper tanks in those days—was rusted and leaked like a sieve. I wrote to the maker about the price of a new tank and received a letter from the postmaster of the town stating that the incubator firm had gone out of business five years previously. That machine was the first to be entered in my museum of incubator failures, to be followed a few years later by others.

My experience in all these years with incubators leads me to believe the conditions under which a machine is operated have more to do with the success or failure than anything else. The incubators which are being put out now by reliable manufacturers—people who have been in business for at least a dozen years—are as near foolproof as it is possible to make them.

In my earlier days with incubators I used to think that the big hatches were the successful ones. Now I aim to get the largest possible number of strong, healthy chicks that will live and develop into good-sized, profitable birds. I have had large hatches from different makes of incubators, but the large hatches do not always result in a high

KERLIN~QUALITY

English~American S. C. White Leghorns

Hatched in May—In October They Lay

We believe we can, without in the least boasting, make the statement that our experience in hatching, brooding and selecting heavy ALL-YEAR-ROUND LAYERS (which covers a period of more than 20 years) has placed us in a position that we are able to say with authority that you will never get better results from "KERLIN-QUALITY" Chicks than those hatched last May, June and July. These are Nature's grandest months for rearing chicks and our stock develops rapidly. The pullets are paying a nice profit in production of large, white eggs when five to five and one-half months old.

This fall and winter, when only Bred-to-Lay Stock is producing, you'll be glad you purchased "Kerlin-Quality."

BABY CHICKS

For twenty-one years these Nationally Popular Leghorns have been Filling the Egg Baskets for hundreds of our customers, RIGHT THROUGH THE FALL and WINTER MONTHS when EGGS ARE DEMANDING A HANDSOME PRICE! It's born into them—they simply can't help it. Do not merely accept our word for the quality of our birds—

And read the dozens of unsolicited testimonials received from every state in the Union, Canada and Cuba. Here are a few extracts that express the thoughts of thousands of breeders of our English-American 265-270 Egg Strain Stock.

THREE THOUSAND MILES, AND GOT MORE THAN HE PAID FOR!

Kerlins' San Bernardino, California, March 3, 1921.
Gentlemen:—As per your request am mailing you report of the 100, plus 12 "extra" Day-Old "Kerlin-Quality" S. C. W. Leghorn Chicks shipped me last week. They arrived today at 12:30 p. m. Four were dead upon arrival and three more died within a few hours and three more are a little weak. THIS LEAVES ME TWO MORE CHICKS THAN PAID FOR and THEY ARE VERY LIVELY. Considering the distance shipped, this is REMARKABLE and I am very well satisfied. I thank you for the interest shown in my order. Yours for success, A. L. KRUG.

DO MAY-HATCHED CHICKS PAY?

New York, Jan. 1921.—You will recall I purchased 200 day-old "Kerlin-Quality" Chicks last season, shipped by you May 13th. Raised 101 pullets, one was killed, leaving exactly 100 Choice Pullets. I GOT MY FIRST EGG OCTOBER 7th. 147 days from date of their hatch. During November they produced 1424 eggs, December I gathered 2317, AN AVERAGE OF A SMALL FRACTION LESS THAN 75 PERCENT. They are "Shelling Out" every day, and it looks better for this month. I now have an order with you for 1,300 MAY-HATCHED CHICKS. Needless to say I am delighted with "Kerlin-Quality."
—Michael Wright, Jamestown, N. Y.

12 Weeks Old-PULLETS-12 Weeks Old

Every one a choice "Kerlin-Quality" Bird and these, like the Chicks, sold at a live-and-let-live price. We have established a record for Quality in these birds that is indeed enviable. Several hundred choice pullets to spare each week on and after May 3rd.

Do Not Overlook the Advantages To Be Derived from

OUR FREE SERVICE DEPARTMENT.

This department throws open to our customers the experience we have had the past twenty-one years IN EVERY DEPARTMENT OF THE INDUSTRY. Raising the Chicks, Feeding and Caring for the Layers—ALL PERSONAL MATTERS CAREFULLY and PROPERLY ATTENDED TO.

FREE FEED WITH EACH CHICK ORDER!!!

Our "Formulas and Methods" are free to our customers. These are the results of our many experiments and discoveries along different phases. The Celebrated Method No. 1, gives simple and positive instructions for FEEDING 100 LAYERS for 30 cents PER DAY! Sounds almost unbelievable but it is true. One customer from Ontario, Canada writes: "Mislaid my copy of your Formulas and Methods. Please mail another copy at once and I will pay your price for this second copy. I would scarcely take any amount of money to be without that valuable Looklet."

WRITE FOR OUR CATALOG—RIGHT NOW!

You will be surprised to know what our stock has done for others—and what it will accomplish for YOU. Please remember you can order "Kerlin-Quality" English-American S. C. W. Leghorns through others but SHIPMENT MUST BE MADE BY US to be GENUINE. This warning is for your protection.

We are booking orders rapidly—WRITE OR WIRE YOUR NEEDS. If it is LARGE, WHITE EGGS you want, we have a strain that has been proven by almost a quarter of a century to be in a class unexcelled in this particular achievement.

We Will Soon Be Booked Full on Orders—Drop That Card Now.

percentage of the kind of chicks I want. The chicks that live and thrive are the ones that show profits for the poultryman.

I have discovered that only properly hatched chicks are worth putting into the brooder, and nothing is more discouraging and troublesome to rear than a brood of weaklings. The mortality

is heavy and time, labor, feed and the interest on the plant are therefore lost.

In the operation of an incubator, to get the best results it is necessary to study the machine and acquaint yourself with all the working parts. The operator of an incubator must be careful and thorough in his work, no matter if it be a small oil burner or one

of the mammoth hot-water affairs.

If the machine is of the oil-burner type, do not use an inferior grade of oil or a short wick. Learn how to trim the lamp so that it will not smoke. Fill the lamp every day, after the eggs have been turned. This practice will prevent handling the eggs with oily fingers.

Never try to run an incubator in a

PROGRESSIVE WINNERS. BRED FROM THE VIGOROUS STRAIN, HOMESTEAD CAMPINE FARM
 FIRST COCK, NEW YORK, JANUARY 1919. 1ST CKL-NEW YORK 1919, 1ST CK-BOSTON 1920

 C. A. PHIPPS. WAYLAND, MASSACHUSETTS.

drafty place or near a stove or an exposed wall. Such conditions cause an unequal temperature in the egg chamber.

Be sure to turn and cool the eggs every twelve hours between the third and the eighteen day. Do not turn or cool them after they have begun to pip, and do not open the machine to see how the hatch is progressing. Do not try to help a chick out of the shell. If it is not strong enough to come into this world unassisted it is not strong enough to battle for its own with stronger, lustier chicks.

Do not try to hatch eggs that you would not set under a hen. Waste no effort upon eggs that are doubtful in any way, in freshness, fertility, cracked, or badly soiled. Above all, do not crowd the trays with too many eggs, and never place them in any but a horizontal position.

Do not reset the incubator with the trays and drawers—foul and dirty as they are at the end of a hatch. Clean and brush the interior thoroughly and spray with a disinfectant that does not contain oil.

At the end of the season clean up the incubator and leave it clean for the next year. Take out the lamps and store them in a separate place. Clean them thoroughly, and next season when they are put in the incubator they will not smoke.

A. J. Bradley.
Pennsylvania.

Chinese Eggs and Spring Prices.

In the March number of A. P. J. is an article on "Solving the Chinese Puzzle by Putting a High Tariff on Eggs." The high tariff is all right, and it should be made so high that it will be prohibitive. It is not the yellow peril that is doing all this importing of Chinese eggs, but the little yellow wagon. For why? To break the egg market so they can buy cheap eggs during the spring to put in cold storage. The little yellow wagon and other cold storage people make a drive at the big egg markets the latter part of January and during February every year, in order to buy cheap eggs to put into storage.

If the egg farmers will pass a law compelling retailers to sell cold storage eggs at least 25 cents (or 30 cents would be better) under the price that fresh eggs were selling at, then the cold storage people would have to boost the fresh eggs in order to sell their cold storage eggs at a good profit.

Last winter when eggs in New York City were at top prices, there seemed to be a limited demand for fresh eggs. Upon investigation it developed that some grocers in New York City were buying storage eggs at 75 cents and retailing them at \$1.28 to \$1.32 a dozen. They would not buy the fresh eggs for they were quoted at \$1.10. Now that is the proposition that the egg farmer is up against, the cold storage people on the one hand and the retailer on the other hand. What we need is organization.

Md.

Francis Knowles.

Note: Dealers in eggs are required every spring, by the very nature of their business, to borrow money at the bank and buy the seasonal surplus of eggs. Store these eggs, and, in doing so, pay the cost of refrigeration, insurance and interest; then in the winter bring out the eggs, candle them and meet the losses on those that have spoiled. They must then sell the eggs in the open market. The business is highly speculative. Anyone who wants to can engage in it, and those who do should not be criticised too severely for their tactics. Give the devil his due.

Chinese eggs are a menace because they add to the surplus. They do not amount to more than a fraction of the U. S. production, but it is the surplus that always has a strong tendency to bring prices to a point where consumption will equal supply that the surplus may diminish. The whole thing is a problem in economics, and opinions or heated discussions will not help anybody. A few well-worded letters to congressmen and senators asking that they vote for a 12-cent import duty on eggs in shells and a 15-cent duty on frozen or dried eggs, will do much good.—Editor.

Keipper Collapsible All Wire Coop

FOR EXHIBITING AND CONDITIONING POULTRY

Exhibitors and poultrymen all over the country prefer Keipper Original All-Wire Collapsible Coops not only for show purposes, but for conditioning and training prize poultry, pigeons, and rabbits. These coops can be rented by shows with privilege of buying.

We also manufacture shipping coops, canary shelf, and breeding cages, special None-shock egg carriers, fountains, feed hoppers, and brood coops with runways. Send for FREE catalog today.

KEIPPER NONE-SHOCK EGG CARRIER

Guarantees delivery in perfect hatchable condition. Each egg is placed in an individual container and held in place by rubber bands, which absorb the entire vibration in transit, thus absolutely preventing ruptured tissues. Strong corrugated outer box. Can be used time after time. Shipped flat. Easy to assemble.

FERTILE EGGS AND STRONG BABY CHICKS.

When we compare the baby chick with a house that has had its foundation carelessly thrown together, we can expect to reap the results when the wind storms begin to come our way. This structure can possibly withstand more than one shake-up, but in a short time the weak parts give way and after it is too late, we look back with disappointment to our poorly constructed foundation.

During the cold winter days, when our hens are housed, we can throw in corn and oats and give them water to drink when it is convenient for us and they will live through the winter all right, but when we are ready for hatching eggs our troubles begin. We may get eggs by feeding stimulants and forcing for egg production. A hen can be fat but yet not in egg-laying condition. Her body is lacking in the elements required for the manufacture of eggs. Those hens that do lay, their organs are constantly drained of the body supply until their energy and strength begins to fail.

We finally open our eyes to the fact that our hens are occasionally dying and if we consider the amount of stimulants and self-made tonics such as cayenne pepper, etc., given the hens in large quantities to make them lay, we oftentimes find that this method overtaxes the liver and in fact other organs and we pronounce it cholera or something else, whatever pleases our fancy; and the blame is all on the hen or Providence.

Eggs gathered from these undernourished hens have a tendency to hatch delicate chicks, and the least little offset in feed or brooding conditions will weaken them and about the first disease we have to combat is bowel trouble, possibly we can pull part of them through with buttermilk, but after awhile damp rainy weather is here and we have roup to fight, and it seems as though it is a hard battle to fight all the way through and the number that we do save, even after they are grown are only fit for the market, for if we use these for breeding stock we can always expect trouble and losses. Through my experience I find it a loss to keep more hens than I can properly care for.

The latter part of December finds me ready for the final culling. My selection is made from pullets and one-year-old hens, occasionally older hens are kept if they are special specimens. I keep those that test high in egg production and that pass good Standard requirements.

My pens are mated the fore part of January, headed by strong, vigorous birds selected on the same principle as hens. With plenty room for exercise, fresh clean water, dry mash, either commercial, or my own make, with practically same ingredients, oyster shell and grit, and when meat is not contained in mash I substitute milk, sprouted oats and a scratch feed of cracked corn and oats in a litter of straw is fed each day during the winter. Also my own judgment as to ventilation, and when it comes time to save eggs for hatching I leave the pepper on the shelf in the cupboard and if at any time I think a tonic is needed I purchase a package that has been tested and prepared by an experienced specialist. These we

Bees Increase Poultry Profits

When poultry work is heaviest, bees need little or no attention. When poultry work is lightest, the honey-money crop comes rolling in. People who succeed with poultry will find pleasure and profit in beekeeping. Small expense to start. Our 50 years of experience free to you. find advertised in all our poultry journals.

I have found by following this method that the percent of high fertility in eggs tested generally come up to my expectations and the chicks are strong and healthy and I do not have to be tampering with them all the time trying to keep them alive. Last season I

hatched eleven hundred chicks. Kept 600 and sold the remainder. Placed 300 chicks in each of my colony houses. Raised practically every chick except a very few that the hawks raised sooner than I could. Eggs gathered in January of this season have tested equally as good as I expect them to test in April and May.

I have three incubators running with 140 eggs in each, and hardly enough eggs tested out to make proper room for hatching time.

If I cannot hatch all the chicks I can take care of and several hundred besides, with my 100 hens, as a side line, it will be my own fault in management. Illinois. Mrs. Frank H. Miller.

WHAT I SHOULD LIKE TO SEE.

By F. W. PROCTOR.

I should like to see poultry-utility contests supplant these misleading, inconclusive attempts, conducted under unequal and unfair conditions, to show comparative merits of breeds as based upon annual output of eggs.

The underlying motive of egg contests is, or should be, to demonstrate in a comparative way the practical utility of the several breeds and varieties of hens. However, as the egg is but one element in the economic status of poultry, the value of the carcass of the surplus males and ultimate use of the layers also as food being a constant factor in profits, we can never consistently claim that egg contests, as conducted, are anything better than a bluff, calculated to hoodwink the unreasoning public and to foster the commercial advantage of the contesting breeder's skill in selecting competing specimens, on those whom luck and chance favor.

That our present day egg contests are nothing better than a "delusion and a snare" and unworthy of serious consideration becomes apparent when we look closely into conditions under which they are conducted. They deserve a place under the category of sports, a standing joke among people who are accustomed to think. However, equal conditions for all contestants is a universal rule in the sporting world, which in this instance is wanting.

Speaking now of the capacity of the several breeds for egg production, when unequal numbers of pens of the competing breeds are represented, as, for instance, several pens of White Leghorns and Rhode Island Reds for each pen of Plymouth Rocks—a disparity that generally obtains—thus giving two former breeds several chances to one for the latter, how can such a handicap signify superior merit for the winning pen or individual when such falls within the more numerous classes?

And when the numerically smaller class wins, as instanced by Jules Francais' Barred Rocks winning two consecutive seasons at Storrs, Conn., against several times as many entries of Reds and Leghorns, the honors are so many times multiplied in importance.

Let us now proceed to consider under what conditions a poultry contest might be conducted which would actually prove an index of the comparative merits of the several breeds, or would suggest, if not actually establish facts when the average was struck of many successive contests.

Egg Production Not the Only Matter.

First, as egg production can never be dissociated from the hatching and rearing of the layers, and the carcass constitutes an essential element in the ultimate profits, the varying values of the carcass of the several breeds must be reckoned. This consideration opens up several important problems which it would be well for experiment stations to work out.

The larger breeds are not only the most important as meat producers but are also the most inclined to become broody. The periods of broodiness have a tendency to carry egg production into the season of egg scarcity, thus giving the Plymouth Rock an egg price advantage over those produced by non-sitting breeds. This is a consideration which is ignored in egg contests, but has an important bearing upon the ultimate profits. It has been stated that the hen which is allowed to hatch two broods of chicks thus undergoes a period of rest or changed occupation which proves an asset in her later usefulness as an egg producer.

Besides the unequal representation of the different breeds competing at egg contests, which I have mentioned, another offset to dependable results is the entire absence of many breeds well worthy a place. I would like to see the Redcap, American Dominique and Black Javas figure in these public tryouts of the laying capacity breeds.

When it comes to carcass considerations, another element that deserves a place is the gross meat producing capacity of breeds, namely, the edible quality. Certain American markets grade eggs as to quality, a consideration which has to do with externals often; but there is a vast difference in the meat of breeds. As other meats go, based upon quality, the flesh of the Dorking should command a fancy price, say twice that of a Rhode Island Red. The Dorking is not likely to become a feature of American markets. The Plymouth Rock and more especially the Barred Rock variety, is par excellence, the super quality of poultry meat. Even at advanced age this breed fails to degenerate with the proverbial "tough old" fowl. A two-year old cock is still prime. But I am digressing from my theme.

The experiment stations might better be employed in developing the neglected meat

side of poultry keeping than to keep up this everlasting bluff about laying capacity, which never gets anywhere because never starting for anywhere in particular.

Are Meat Values Being Sacrificed for Eggs?

In the golden age so often heralded and which still hangs as a mirage upon the horizon, perhaps experiment stations will see the light and cut out this egg-spouting business; to start something practical that would be truly demonstrative of the comparative worth of breeds. Let them try out a well rounded list of the most promising fowls for combined meat and egg producing qualities. Raise the competing pens at home, upon their own grounds, under identical conditions. Feed the pens not according to set rule but according to their breed requirements. Study market possibilities to ascertain whether the public will stand a commensurate price for a Dorking carcass, or will pay the difference in cost of production, if any, between a luxurious Rock or a mediocre Red.

I am speaking of this difference in the edible quality of the flesh of the different breeds without prejudice, but from a personal acquaintance with many breeds and crosses. My own experience with Reds tallies with that of Mr. Dustin as told in a recent issue of the Journal. The Rhode Island Red invariably provokes unfavorable comment from patrons accustomed to Barred Rocks. As layers the Reds stand pre-eminent. And where the breeder's concern stops there, little need be said; as when his surplus goes into the open market. But again, from the marketman's standpoint, as evidenced by Mr. Dustin's statement, if discriminating as to quality he would pass by the inferior fowl in favor of what would better satisfy his patrons.

This problem of what makes for edible quality in poultry is a most evasive one. I have often considered whether color of plumage or skin had a controlling influence upon the flesh. The French are the great connoisseurs in this matter. Their La Fleckle has emphatically the flesh from the point of delicacy. Their Creve Coeur and Houdan share with that prime favorite in quality as well as prevailing black color of plumage. In this latter respect the Barred Rock falls in line, black being its only pigment. Next come our white varieties, which have been evolved from black.

Should we presume red color of plumage to be in general attended by flesh which hardens early and lacks succulent flavor we should lack satisfactory evidence from our limited observation. The Buff Cochins' coloration is similar to the Red, differing in amount of pigment solely; and that breed formerly had a high standing as to its excellence of flesh. I well recollect that a young marketman asked me where he could obtain eggs for setting of "that big yellow breed with feathers on its feet;" explaining that his customers liked its meat best of any. This was in the days when Sharpe Bros. were about the only prominent breeders of Buff Cochins.

This article has run out to surpassing length and I have wandered somewhat from my subject. So I will close as I began, by saying I should like to see egg contests evolve into a test of the actual all round economic values of breeds. It is plain that they never can do this as at present conducted, considering neither the seasonal differences in egg prices nor the worth of our domestic fowls' very valuable carcass.

Co-operative Marketing.

H. C. Wallace, secretary of agriculture, and member of President Harding's cabinet, said in a speech on April 6:

"Nobody has ever disputed the right of the manufacturer to market his own products, and I don't see how anybody could justly deny the farmer the same right. It has too long been the case that the farmer was expected merely to produce and to take his chances on somebody else's market.

"There is just as much reason why the U. S. Department of Agriculture should assist in intelligent marketing as to promote increased production. It is our business to reach for methods of getting products to the consumer efficiently."

Where Imported Eggs Come From.

The United States imported 1,708,701 dozen eggs, valued at \$617,909, during the year 1920. China was the chief source of supply, 846,863 dozen coming from there. Canada furnished 276,392 dozen, Hongkong 269,567 dozen, Australia 209,718 dozen, Japan 84,755 dozen, and Argentina 21,000 dozen.

During the same year the United States imported 29,022,577 pounds of dried and frozen eggs, valued at \$7,233,614. China furnished 25,646,791 pounds of this product. England sent us 2,378,752 pounds, Norway 340,000 pounds, Canada 311,052 pounds, and Japan 131,475 pounds.

BUCKEYE Poultry Raising Equipment has again proven its superiority.

Three quarters of a million users have again demonstrated its wonderful efficiency, its reliability and its remarkable economy, in another season of success.

Get Quick Growth SAVE FEED

Now is the time to develop your chicks to early layers and for market. To know how to feed for quick growth and still save feed is told in a new 96-page book, written by T. E. Quisenberry, one of America's greatest poultrymen.

This book also tells you: how to market for top prices; how to prevent loss from disease; how to cull slackers and poor layers; how to breed to get big winter egg yields, when egg prices are sky high.

Mr. Quisenberry's new book tells you secrets gained from over 30 years' experience as a practical poultryman. He will send a copy absolutely free to anyone who writes him in care of The American Poultry School, Dept. 2065, Kansas City, Mo.—Adv.

TOULOUSE GEESSE.

By OSCAR GROW.

The show season of 1920-21 witnessed a most gratifying revival of interest in the several breeds and varieties of waterfowl. Gratifying, for the reason that Americans, in contrast with European fanciers, have been rather tardy in appreciating both the fascination and utility of this phase of poultry culture; but the surprisingly large classes of both ducks and geese exhibited during the season just passed, at not only the National shows but those of a more local character, unquestionably signify that their true worth is becoming recognized and that from this time forth they will vie with the numerous varieties of chickens in public esteem.

If there was any single breed of waterfowl which appeared more conspicuous than the rest during these recent manifestations of growing popularity, it must be admitted the distinction belongs to the Toulouse Goose. And to those who are better informed in waterfowl mating this decided preference is not at all surprising; for there is not another breed of fowls which will reward its advocates with as large returns for the small amount of time, labor and capital involved as will the Toulouse.

The largest of the domestic goose family, they are also the most quiet and docile, qualities which are wanting in some of the breeds. Their chief virtues, however, lie in their superior fecundity and rapidity of growth. The Toulouse has the reputation for being the best layer of the larger breeds and the better strains also markedly excel in quickly taking on size and weight. Indeed, it is quite possible to produce fifteen pound goslings at five months of age with a less expenditure for feed than is required to grow chickens but one-half that weight. All this being accomplished without the constant precautions necessary to guard against the vermin and diseases to which young chicks are always more or less subject. To thoroughly exhaust the utilitarian virtues of either geese in general or the Toulouse in particular, would be entirely beyond the compass of this article, so I shall devote the remainder of the space to which I am limited to considerations which appeal more especially to the fancier, in as much as it is quite necessary that there be agreement in these respects if the Toulouse is to retain its front rank among breeds of waterfowl.

Characteristics of the Toulouse.

Upon viewing a typical Toulouse Goose one is immediately impressed with its massiveness; an impression which is due to two very striking characteristics, viz: the shape of the head and the very deep keel; features that are so vital, in fact, that they are worthy of primary consideration but which will be deferred, for convenience, to their appropriate places. To begin with, the beak should be short and very stout or thick at the base, free from any tendency to snappiness, whatsoever. When such a beak is attached to a short deep head you have the vanguard of an ideal Tou-

LADY PURITAS

Half Price on EGGS and CHICKS FROM PURITAS SPRINGS S. C. W. LEGHORNS

LADY DID
Laid 317 Eggs in Year

Trapnested For 10 Years Without Missing One Day.
EVERY NEST ON PURITAS SPRINGS FARM IS A TRAPNEST.
Hatched June 22d; All Were Laying in December.

Puritas Springs Poultry Farms:

Ames, Iowa, February 15, 1921

Dear Sir: Last season I purchased of you 50 baby chicks and was very much pleased with the treatment you gave me, and was more than pleased with the chicks. Although they were hatched and shipped June 22, 1920, they were laying in December. Just a few days ago I received 17 eggs from the 19 pullets.

I will be in the market for either eggs or chicks, and I may want both. Please send me your 1921 catalog by return mail. Wishing you a prosperous year, I am respectfully yours, F. C. SWANK.

We could not supply the demand for April eggs and chicks. Now is your chance to get eggs and baby chicks from the world's greatest layers at half price. Eggs will be half price after May 15; chicks will be half price beginning June 1. Send at once for our reduced price list on eggs and chicks. Kindly mention if you have our big, instructive 1921 catalog which describes our stock and gives much valuable information. We can supply 8 to 12 weeks' old pullets and cockerels any time from now on. Please order early.

louse, especially if the eye is situated fairly high in the skull.

Joining the head to the body should be a rather thick, medium length neck, embellished, in mature specimens with a pendulous dewlap extending well down upon the neck. This dewlap is one of the distinguishing features of the breed and its absence, particularly from mature ganders should be considered such a serious defect as to debar the entry from a first prize in the showroom. The absence of both dewlap and keel should prove fatal and stamp the specimen as unworthy of any prize, for the reason the entry lacks breed characteristics.

Unless judges insist that winning birds approximate the Standard there will continue to be as many types of Toulouse bred as there are breeders showing them. And moreover, as long as Toulouse devoid of both keel and dewlap win at our leading shows there will be no dependable way of distinguishing the purebred from the common grey mongrel which hucksters have so long imposed upon the unsuspecting public for the genuine article.

Since the Standard calls for keel and merely expresses a preference for dewlap, the absence of the keel must be penalized severely. On the other hand the correct shape of the keel when present must be insisted upon. This keel should be deep, the deeper the better, and should extend forward from the abdomen well around the front of the breast, forming what is equivalent to a bow to a ship. It will be perceived that a keel answering this description must be single, if the term may be used to distinguish it from the so-called double keel or divided breast seen on some winning Toulouse at recent shows. Yet it is very patent to any one who will devote but a moment's thought to the matter that no interpretation of the term "keel" can be made to include the double or divided breast. To the contrary, the double breast is the very antithesis of keel and is as much out of place on a Toulouse goose as it would be on a Rouen, Pekin or Aylesbury duck.

In harmony with the keel, the abdomen should be, likewise, very deep; in adult individuals, touching the ground and completely filling in the space between the legs. This width and depth should also be carried back sufficiently far to give the stern a square appearance.

The back on the best birds is broad and of good length, at the same time revealing a perceptible arch from the neck to the tail. The tail being short and carried well spread.

One fault frequently met with in the showroom is inadequate length of legs. While a stilty bird is equally objectionable still there must be sufficient height to allow for the characteristic depth of body. This is not possible with a short legged specimen. Another quite as common fault is a too erect carriage. The cause is due to the legs being set too far back on the body in the manner of the Pekin or Indian Runner duck. Such carriage foreign to the Toulouse breed and ought to be severely discouraged when placing the awards. In the best strains the body is maintained nearly horizontal.

Color of plumage is something which does not often perplex the Toulouse breeder. The representative strains are uniformly good in this respect, although one occasionally meets with lack of definition in markings. This shortcoming results as frequently from too dark as from too light grey ground color, but it is seldom encountered where extremes are avoided. The truth is, there is far more difficulty experienced in breeding Standard type than in breeding Standard color and therefore the Standard has placed a valuations of but thirty points out of one hundred on color requirements.

Before concluding I wish to again emphasize that there is no branch of the poultry business more remunerative or interesting than the breeding of Toulouse geese. Each successive season lists many new breeder converts and with proper co-operation from both the poultry press and the poultry shows they will deservedly continue to be ever increasing factors in the poultry world.

Save the Feathers.

I always save all the feathers when I kill a chicken. The stiff feathers can be used as brushes to clean places that are hard to reach in any other way, and the tail feathers, especially rooster feathers, can be colored and used as decorations in various ways. The down and the soft feathers on the breast, under the wings and along the back make good fillings for sofa pillows and chair cushions.

I made several pillows and chair cushions from pretty cretonnes and filled them with feathers I had saved from time to time; and I priced some cushions made like these in the stores, and the prices ran all the way from five dollars to twenty-five dollars; and I made mine from scraps and feathers some people throw away.

I cure the feathers by putting them in a stout paper bag, then tie or pin the bag to the clothes line and leave them there till they are dry. After they are dry I put them in a thin muslin bag or old pillow slip, and put them out on the line every sunny day, being sure to bring them in if it rains. After they are cured, which takes about four or five days of sunning, I sort all the feathers, putting all the dark feathers in one bag and the light ones in another.

One has no idea how many feathers they can save in a year. I have saved pounds and pounds of them in a year, and my family was small, so we didn't eat many chickens. Good hen feathers are 30 cents, a pound, too.

Lovely quilts can be made by using feathers as a filling instead of cotton batting, and beautiful flowers are made of chicken feathers. I always keep a few stiff feathers in my machine drawer as they can be dipped in oil and are better than the oil can for oiling places hard to reach.

Virginia. Mrs. J. J. Imobersteg.

Hens' Heads Becoming Bald.

Hens, especially those in confinement, may lose the feathers on top of their heads at this season as a result of the activity of the male. Birds on free range, as a rule, do not become bald on top of their heads. These feathers will grow in again later on in the season when the birds molt.

BABY CHICKS

DOWN goes the prices again for MAY and JUNE

EARLY BLACK JAVA HISTORY.

By H. W. HARWOOD, M.D.

Permit me to give your readers a well authenticated account of the origin and early history of the Black Java, which historical account, until the last year, was not generally known.

It was known that J. Y. Bicknell and other real fanciers brought this breed into much prominence years ago, and that they traced it back to a Missouri doctor who had some of these fowls and would not let anyone else in his community have any of the stock. However, someone "borrowed" a few eggs from his yards, and the birds obtained in this way were taken to New York state, and fell into the hands of Mr. Bicknell and others who gave the breed much prominence. But we are now able to go a long way back of the Missouri doctor in tracing the origin of the Black Java.

J. Lyman Kelly, a native of Hampshire county, Mass., but for twenty years past a resident of Franklin county, N. Y., a printer by occupation, a man of good intelligence, reliable, and withal a keen poultry fancier and exhibitor, has the following to offer regarding the origin of the Black Java.

Many years ago, he committed this information to writing: "I have known of this breed since a small boy, or about forty-six years. During that time they have continued to breed true to type, in fact rather more so than any other breed I am acquainted with. (The Black Javas exhibited at the recent Franklin county, N. Y. Fair show the same type and characteristics as those of over forty years ago.) As early as 1835, a sea captain by the name of Samuel Scoville (or Scofield) who sailed for many years from Bridgeport, Stonington and Providence and was engaged in the spice and hemp trade at the ports of the Isle of

Java and Sumatra, brought home a number of Black fowls much the shape of our Rhode Island Reds of today, and having smooth black legs, and presented them to Amasco Converse of Massachusetts.

"This sea captain and Converse had been friends from boyhood and he never returned from a voyage without visiting him and bringing some remembrance picked up in his travels.

"These black fowls were much larger than any previously owned in those parts, and created quite an interest in the community where Mr. Converse lived. He in turn presented some of the fowls to a niece, Lucy Converse, who later married Lyman J. Tower, of Worthington, Mass. She was famed for her success in breeding Grey Geese, Black Turkeys and the so-called Java fowls.

"Unlike the selfish Missouri doctor who doubtless obtained his Javas from the Converse stock, she did not keep her

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912.

Of AMERICAN POULTRY JOURNAL, published monthly, at Chicago, Illinois, for April 1, 1921.

State of Illinois, County of Cook, ss.

Before me, a Notary Public, in and for the State and county aforesaid, personally appeared James W. Bell, who, having been duly sworn according to law, deposes and says that he is the Editor of the AMERICAN POULTRY JOURNAL, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher—James W. Bell & Co., 523 Plymouth Court, Chicago, Ill.

Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.

Managing Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.

Business Manager—James W. Bell, 523 Plymouth Court, Chicago, Ill.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)

James W. Bell, 523 Plymouth Court, Chicago, Ill.

H. M. Bell, Congress Park, Ill.

Henry G. Eisert, 523 Plymouth Court, Chicago, Ill.

B. M. Eisert, 4040 Broadway, Chicago, Ill.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.)—None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is — (This information is required from daily publications only.)

JAMES W. BELL,
Editor.

Sworn to and subscribed before me this thirtieth day of March, 1921.

(SEAL) ALICE A. SHEHAN,
Notary Public.

(My commission expires June 20, 1924.)

things to herself, but scattered them good things to herself, but scattered them far and wide.

"When I lived with her as a small boy, there were probably forty families in Hampshire county breeding Javas, chiefly for their meat producing qualities. It is more than probable that the blood of these Javas entered into the formation of both the Barred Rocks and Rhode Island Reds.

"The Lucy Converse Towner mentioned was my mother's mother and I lived with her when a boy, and from her received my first lessons in poultry keeping, which have been of much value to me. Grandmother was very proud of her Javas. She was my informant regarding their origin. It is certain that they came from the Isle of Java."

Now, Mr. Editor, what can be more direct than this account of Mr. Kelly's? All of the early breeders of Black Javas agree that the breed of many years ago was exactly like the pure Black Java of today. Such as Bicknell, Whiting, Mathews and others have bred. It is true that some show managers who were not specially interested in this breed sometimes classed them with other large Black breeds as Cochins, but that is not strange.

We are sure that Mr. Bicknell never classed them in this way, nor Mr. Whiting, nor Mr. Mathews. In this same careless method of classification, Cornish have sometimes been put in with Pit Games. The Black Java is a pure-bred which from its first introduction into America has had its own characteristics, and all who have bred and carefully studied the Black Java agree that crossing it with any other destroys these characteristics.

For example, C. S. Whiting says: "a pure Black Java will always have a dark eye, and that a bay or red eye always denotes the introduction of other blood." I submit this paper for no other purpose than to have the true history of the Black Java established.

SETTING HENS FOR MAY HATCHES.

By OTTO E. HACKMAN.

That there is a right and a wrong way of setting hens is seldom taken into consideration by many poultry raisers who use the natural way of hatching chicks. So much really depends on how the hen is set that I feel a few words in this regard will not be out of place; on the contrary, I am sure it will be of interest to quite a few readers.

The hen is relied on by quite a few poultry raisers to hatch all the chicks required; especially is this true with regard to those who do not raise many chicks in one season. The small breeders who have a sitting breed of hens will always adopt the natural method of hatching and rearing. Even the owners of non-sitting varieties use this method to some extent as they usually buy or borrow the hens to do the hatching.

The Nest.

The first thing we will consider is the nest. Too many fail to use proper care in making and preparing the nest boxes. Any old box, just so it will hold the straw and keep the eggs in, is pressed into use. No thought or care is given to the size or shape of the box. It is no credit to anyone to have eggs chilled or smashed in the nest, caused by im-

properly constructed nest boxes. The nest should be large enough to allow the hen to turn around easily.

A nest fifteen inches square and fifteen inches high is about the proper size. Do not have the front of the nest the same size as the sides and back, however. The entire front should be open except about five inches at the bottom. This five-inch board in front, at the bottom, will be high enough to keep the nesting material in place and prevent the eggs from rolling out. It also tends to allow the hen to go in and out easily. The top of the nest should be covered, but not nailed down.

If the top were nailed on it would be necessary to remove the hen from the front. This is not good practice as some eggs are often pulled out with the hen and broken. By having the top loose we can lift the hen off easily and with no danger of breaking the eggs. It is preferable to either have the top hinged or secured by hooks. By having the front open as high as the sides and back it would be necessary for the hen to enter the nest from the top. This is likely to result in broken eggs as the hen often jumps down upon the eggs. In entering the nest from the front the hen will necessarily have to step in slowly.

The bottom of the box should be covered with several thicknesses of newspapers, allowing the edges of the paper to come up the sides a few inches. This will effectively prevent any possibility of drafts coming through the bottom of the nest. Then a piece of sod fifteen inches square should be cut and placed in an inverted position in the bottom of the nest. This sod has a tendency to supply moisture to the eggs, which is essential to a good hatch of strong, vigorous chicks. Fill up under the corners of the sod with either earth or finely cut straw. This will tend to form a sort of pocket in the center and will keep the nesting material in better shape.

A few inches of straw, hay or other soft material should then be put in, packing it well down and hollowing out until it is in the shape of a saucer. Do not make the hollow too deep, however, as this would throw the eggs together in a heap in the center, which is likely to result in some becoming broken. A too shallow nest is also to be avoided as this will allow the eggs to roll out from under the hen and she would have difficulty in covering them.

The number of eggs to be placed under the hen should also be taken into consideration. While fifteen eggs are usually set at one time this is, in reality, too many for a hen to properly cover. One should never put more than thirteen under one hen early in the season when the weather is still cold.

We seldom get more chicks from fifteen eggs than we do from thirteen, and the chicks are not likely to be so vigorous as those from the smaller number set. This is because a hen can not properly cover fifteen eggs and some are sure to get slightly chilled at one time or other, which will surely prove detrimental to a good hatch and healthy, vigorous chicks.

The Kind of Hens to Set.

Some may contend that they have large hens and they can easily cover this number of eggs. While this may be true I will say that extra large hens should not be used for sitting purposes. They are usually so awkward and heavy that they are likely to break some of the eggs in

From Chicks to Market in 10 Weeks

New Free Book by One of America's Leading Poultrymen Tells How.

How to develop young chicks, on less feed, to early layers and for market is told in a new 96-page book just written by T. E. Quisenberry. This book tells hundreds of secrets gained by Mr. Quisenberry in his 30 years' experience as a practical poultryman and is worth many dollars to anyone raising poultry. It tells how to select layers; how to prevent loss from disease; how to get big winter egg yields; how to make every hen pay a profit. Write Mr. Quisenberry in care of The American Poultry School, Dept. 2064, Kansas City, Mo., for a copy of this free book before they are all gone.—Adv.

getting on and off the nest. It is the medium sized, quiet hens that make the best hatchers and mothers. It is only safe to put fifteen eggs under one hen during the hot months of summer, as they are then less likely to become chilled.

In the early spring, if the hen is under-sized, it is best to give her only eleven eggs to cover. Should any eggs become broken the nesting material should be changed immediately. The soiled eggs should be washed with lukewarm water; this is imperative, as the contents of the broken eggs will coat the others and smother the chicks in the shell.

If the hen is set inside a building and it is too early to permit her to run out, it is a good plan to loosen up the earth around the nest boxes. If the earth is dry, sprinkle slightly. The hen will get the feathers on the under side of her body slightly moist, and then when she returns to the nest this moisture will be applied to the eggs.

The setting hen should be well fed. She requires lots of feed for bodily nourishment while brooding. In early spring the feed should be of a heating nature. Whole corn is perhaps the best for this purpose. The hen should be kept supplied with green food and sharp grit. A setting hen has little opportunity to exercise and pick up grit, therefore her welfare must be looked after so she does not become debilitated.

The hen should be dusted thoroughly with lice powder before setting. Also, she should be dusted again in a week and then again about a week before the hatch comes off. I wish to caution the readers about dusting the hen at night. Do this in the daytime, if possible. I lost a hatch by dusting after dark. The hen left the nest, presumably on account of the powder irritating her, remained off all night, and as a consequence the eggs were chilled and ruined. If the dusting must be done after dark, one should look to see if she is still on the nest a few hours later.

As soon as the chicks have hatched and have dried off, a drop of lard or a little olive oil should be applied to the head of each, to kill and prevent head lice, a bane to chick success.

Feeding Baby Chicks.

Now is the time to be preparing for the chicks which are to hatch during the next two or three months. Sour milk is the first food which should be allowed to enter the chick's mouth. It is worth whatever it costs regardless of price for the first few days' feeding.

As the chick is supplied with egg yolk and the sour milk furnishes a readily digested food, the chick's next need is a strong digestive system. With this aim in mind, give the chicks plenty of grit and a small amount of chick feed, what they will clean up quickly five times per day during the first week. At the end of the first week chick feed may be fed three times a day and dry mash kept constantly before them. In case chicks have to be confined, or if there is any difficulty from leg weakness, ten percent bone meal may be added to the dry mash below. All scratch feed for chicks should be fed in a very light litter, consisting of clover chaff or cut straw. The following rations are recommended by the Connecticut Agricultural College: **Dry Mash.**

Bran	2 lbs.
Middlings	1 lb.
Beef scrap	1 lb.
Cornmeal	1 lb.
Ground oats	1 lb.
Scratch Grain.	
Cracked corn	1 lb.
Wheat	1 lb.

The secretary of agriculture, H. C. Wallace, says: "This nation cannot afford to permit the breaking down of its own agriculture, even if for a time we can buy food and other farm products cheaper from someone else."

SUGAR GROVE, PA.

GROWING CHICKS IN LIMITED QUARTERS.

(Continued from page 562)

can't get out or the egg would be a weakling anyway and should be killed even though you got it out of the shell; the heat won't kill or injure the chicks a particle, but the cold air you admit will; you really don't need to see the thermometer. If the incubator has been running properly right along and you have noticed how high the damper stands from the lamp support, just watch the damper and have it about the same and you won't go wrong.

If your chicks started to hatch on the twentieth day the hatch of all worth while eggs will be over on the 21st day. If all your eggs were of the same relative freshness, all that don't hatch on the twenty-first day will never amount to anything, even if they do hatch, and you are better off without them. After all are dried, you can now slightly open the glass door if the chicks complain to much of the heat. Let them in the incubator for forty-eight hours. This, too, seems unnecessary, but is necessary for best results. It gives the chicks time to thoroughly dry off and the slight opening of the door will gradually harden them off. It will also help to prevent you from yielding to your desire to feed them. Half the chicks hatched are killed or injured by feeding too early. The yolk of the egg they draw up into their body just before hatching furnishes them every particle of feed they should have for a full forty-eight hours and every particle of food you give them before that time is over-feeding and positively permanently injurious. Don't.

At the end of forty-eight hours remove them to their soap box home. I have it in the kitchen, where it is handier for the wife. Put the chicks in, adjust your muslin covered wire frame in the slots so that the muslin hanging down just barely rests on the chicks' backs. Then put your cotton-filled pad so it covers the top snugly. Let them stay in for half an hour or so to warm up, then feed.

Feeding the Chicks.

How you feed the first eight weeks and the care taken of the chicks determines the kind of a chicken you will have when full grown. A chick, properly raised the first eight weeks of its life, will stand a lot of neglect and abuse in after life and still turn out a vigorous, sturdy chicken, but a chick improperly raised and fed the first eight weeks of its life will never be a real chicken, no matter if given the very best of care during all the rest of its life.

For the peeps' first meal I hard boil a few eggs, grind them up in a meat grinder, shells and all. Over this I lightly sprinkle a little fine sand. Fill up the water fountain and let out the chicks. If good, healthy chicks they'll pop out like flies ready for their first meal. I dip the beaks of every one in the water if they do not drink themselves in a very short time. This gives them a start and shows them the water supply. Milk, either sweet or sour, would be better, although for convenience sake I use water. If you do use milk feed it always either sour or always sweet—do not alternate from one to the other. This is where the inconvenience of milk comes in.

When they have apparently nearly satisfied their appetites, but not quite

Blatchford Calf Meal Co.,
Waukegan, Ill.

Gentlemen: I purchased 125 day-old chicks May 12th and started them on Blatchford's Chick Mash. I raised 124 out of 125 and had 70 pullets. The Chick Mash developed them rapidly. At 5½ months these pullets were producing 51%. At 5 months old had the yearlings not been banded, the pullets could not have been distinguished from the yearlings, being perfectly developed and combed out.—Geo. K. Snyder, 154 Downs Street, Kingston, New York.

These pullets laid
51% at
5½ months

THE way to make greatest profits from your poultry is to mature them early. The way to mature them early is to start and grow them on

Blatchford's CHICK MASH

(formerly known as Blatchford's Milk Mash)

PULLETS that start laying before the cold weather of early winter sets in will lay all winter. Broilers and roasters that are placed on the market early command the best prices. Users of Blatchford's Chick Mash have found it will start their chicks better and grow them more rapidly than any other feed they can buy. Pullets laying at five months are not at all uncommon when this mash is fed—broilers ready for the market at seven to eight weeks is a common result. All breeds, all varieties of chicks grow to best advantage and greatest profit on Blatchford's. Whether you are raising fancy poultry, utility poultry or market poultry you should be using it. It is a high quality feed made of a wide variety of ingredients that gives greater results for each dollar expended than any other starting feed or growing feed on the market today. Here is the evidence—

Read these letters

"We have been using Blatchford's Chick Mash for the past two years and find it the most satisfactory of any feed for baby chicks. Our last year chicks began laying exactly five months after being hatched."—ROBT. W. REINHOLD, 189 Harbor St., Glencoe, Ill.

"I would not try to raise chicks without Chick Mash. I can grow one and a quarter pound broilers in seven weeks with your Chick Mash."—W. S. CAMPBELL, West Baden, Ind.

"I have used your Chick Mash for baby chicks for the past three years and find it O. K. Last year we had S. C. W. Leghorns crowing at three weeks old. I raise around 1000 each year."—J. E. FROST, Free-soil, Mich.

"I use your Mash for my chicks and have some that, by using it, weigh over 2 lbs. at the age of 6 to 7 weeks."—MRS. H. E. WOOSTER, Bernard, Maine.

"Pullets fed on Blatchford's Milk Mash (now Chick Mash) and your Egg Mash laid at 5 months and 3 days. Twenty-six degrees below zero and my hens showed no let-up."—J. O. LATRIELLA, 525 North 4th St., Missoula, Mont.

"Change your trademark. I have some Cornish chicks that were 8 weeks old June 1st and they weigh over two and a half pounds. I am raising them on Blatchford's. It can't be beat."—W. T. KLUTZ, Waresboro, N. C.

Buy a bag from your dealer or send for a trial carton

If you will once grow a lot of chicks on Blatchford's Chick Mash you will never be satisfied to start or grow them on anything else. We are so confident of this fact that we urge you to send for a trial package. We will send you a **4 lbs. prepaid** four-pound carton, all charges prepaid, for fifty cents. Even this small quantity, if used according to directions, will prove to you that Blatchford's Chick Mash is thoroughly efficient—that it will push your chicks forward more rapidly, more satisfactorily and more profitably than any other feed you can use. Send for it at once. It will insure you greater success with your poultry this spring than you have ever had before. It will enable you to grow your chicks rapidly and grow them right. It will be the best 50 cent investment you have ever made. Use the coupon below. Send it to us today. A 4-lb. carton will be sent you immediately.

Sunnyside Poultry Farm

R. C. Blodgett, Prop.
Box 1002

Bristol, Vt.

fully, back they go into their soap box home for five hours' sleep. Then comes a second feeding, five hours more rest and so on all day until I go to bed at night. Here is where the wife and children come in—to see that they have these regular feeds while I am at the office.

On the third day I put a hopper of chick dry mash before them in addition to the hard boiled egg diet, and also sprinkle enough chick scratching grains so that each chick will get a few grains. To the dry mash I add, for every five measures of the mash, one measure of powdered buttermilk. This furnishes the milk diet and the animal food. Every day I slightly increase the amount of chick scratching feed. It is possible right here to so over feed the chicks that they will grow so large in the body their legs will not support them and leg weakness takes place. The dirt or ground end of the runway will help obviate this to a certain extent, but while it helps it is not the open ground itself, and care must be used. There is something in the ground outside that prevents this trouble.

After the Chicks Are Started.

For two or three weeks this is the daily routine. Then comes their outside growing home. Here I use the Philo system. A Philo coop for growing chicks is a rectangular box three feet wide by six feet long and one foot high. The front is only framing, with 8x10-inch glass the entire length, set loosely in the frames—not puttied. But one-half the bottom is floored, leaving one-half the space open ground. The floored half is raised from the ground

Here's the Way To Keep Eggs Fresh Also Prevent Hatching

Egg-O-Latum seals the shell pores so that nothing can get in or out. Coating neither shrinks, cracks nor swells. No evaporation or air-cell, no odors, germs or decay. Yolk remains whole and in the center. Eggs a year later are exactly as when put down. Poaching, boiling or frying as if under a week old.

Egg-O-Latum comes in two sizes: 50c jar enough for 100 doz.; \$1 jar for 200 doz. Applied by simply coating palms of hands, then rubbing on eggs. Handiest, easiest, best way.

Eggs are cheap now because there is a surplus and the market is flooded. Next winter prices will be high again—at least treble those of this May and June. Don't sell your eggs now. Preserve them with

Egg-O-Latum

Keeps Eggs Fresh One Year

Put down a few hundred dozen now and double your money in less than a year.

Kills Hatching

Many fanciers use Egg-O-Latum on all eggs for the market. Not only keeps them fresh longer, but prevents hatching—thus protecting against the pirates who watch to obtain high grade hatching stock at market prices. Simply wipe off the coating. Does not show. Eggs WILL NOT HATCH. Testimonials sheet and poultry book free.

Sold at Top Price

I gave your Egg-O-Latum a fair test last summer, by putting some eggs away while cheap; they kept fresh until the high price this winter, then my eggs tested fresh No. 1 eggs, and brought top prices here on the market.—Dan W. Carpenter, Box 143, Drexel, Mo., March 12, 1920.

You can get Egg-O-Latum at most drug or seed stores. If no dealer, order by card. Postman will collect. No extra charge. Handy as 'phoning.

GEO. H. LEE COMPANY

about two inches to prevent dampness, and this portion is separated from the other half by a board partition the full width and height, with an opening in the partition for the passage of the chicks from one to the other.

The top is in two parts. First comes the wire screen covered top fastened to the side or made to slide. This keeps the chicks in when the real top is opened. The real top is but a frame, covered with asphalt roofing. To make the open ground end space even with the floored portion fill in additional ground or sand. All simple and cheap, and yet the best.

On the floor of the boarded end of the coop I first spread about an inch of fine cut alfalfa or clover. Then comes about half an inch of chick growing scratch feed, then an inch of the cut alfalfa, another half inch of the scratch feed, and so on until I have enough feed in the coop to last six weeks. That ends my troubles so far as scratch feed is concerned, for they have enough to last them until they outgrow the coop. And I guarantee it works to perfection, too. The chicks are at least two weeks old, the open ground end gives them access to Mother Earth, and you simply can not overfeed them from now on. The only danger now is underfeeding. In the ground end of their new home I place their water fountain and growing mash hopper. These two articles are the only ones need filling from now on.

If your soap box brooder is yet comfortably large enough to accommodate the chicks move brooder, chicks and all to their new home. If it has grown too small build or buy a bigger one—do not crowd. As the chicks grow larger, see that the muslin frame wire is moved

Keeler's White Wyandottes

First Hen Chicago.
Egg Record, 278 Eggs.

The persistent winners at America's Best Show for the last 26 years.

Half-Price Egg Sale Begins May 10th, 1921

Dear Mr. Keeler:— Oxford, Ohio, April 11, 1921.

You may be interested to know we hatched ten strong chicks from Star Mating pen A No. 1 (\$25.00 per 15) and twelve chicks from special pen A (\$15.00). We are well pleased with this and wish to thank you for your promptness and the courteous manner in which you have taken care of our order.

Yours very truly,
K. H. ZWICK.

Dear Sir:— Marlow, Okla., April 12, 1921,

Out of the setting of eggs from pen A and B (\$15.00) half from each pen, I hatched eleven fine healthy chicks. I am giving the chicks the best of care and if they do not prove fine White Wyandottes it will be no fault of mine.

Yours very truly, H. H. Smith.

Eggs are remarkably fertile this season, and on April 15 I had something like 2,000 chicks of my "World's Greatest Strain," so after May 10 eggs will be sold at just half price—\$15 eggs now \$7.50, \$10 eggs now \$5 per 15, \$9.50 per 30, \$14 for 50, \$25 per 100. From quality matings—\$3 per 15, \$5.50 per 30, \$10 per 60, \$15 per 100. Order direct from this advertisement and save time. Look up my last three ads in this journal. My 64-page catalog is free and describes the matings for 1921. Send for your copy today.

Don't Take on Faith

Don't take lice killers on faith, as to results. You should see results. You can see results with Lee's Lice Killer.

A farmer came into my office the other day carrying a couple of sick chickens. Said he was losing ten or more every week. I looked at them and said: "Lice and roup." He said: "Oh, they have no lice. I am using something all the time for that." I turned up the feathers of one hen in three spots and showed him a dozen or more lice. There must have been 500 lice on that one bird and no wonder she was sick and roup. Then I told him what to do.

Now, all you have to do is put a wide board close under the roost, spray or paint it with Lee's Lice Killer and let the chickens roost there over night. The lice die and drop off on the board. You can actually see them there the next morning. No guess work or faith about it. If you shake all of the dead ones out of their feathers, before leaving the roost, you can even count the grand total.

It's so easy to use after you have the roosts once fixed. A little lice killer applied once or twice a month and your birds are free from lice, mites and scaly-leg for all time to come.

SO YOU CAN SEE AND BE SURE

If you guess at it or shut your eyes and say, as many do: "My chickens have no lice," you will never have a really clean flock. It costs little, either of material or labor, to fix up the roosts. Then it is done for good and for all. You can tell, after each application, the exact condition of your flock, or even of certain birds.

Don't Grease Chickens—It is bad for getting on the eggs and ruining them for hatching. And you can not grease them all over.

Don't Dip Chickens—Chickens are not made for watery baths. There's lots of work and generally some losses from dipping.

Don't Guess—With a little dip, disinfectant, powder, lime, etc., scattered around, or a bottle of medicine on the shelf or hung up in the hen house. It's better to know.

Don't Infect Chicks from lousy hens, as is sure to result if the old birds are not kept clean.

LEE'S LICE KILLER IS SURE AND CERTAIN. Easily used, economical, shows results.

In quarts, 60c; half gallons, 90c; gallons, \$1.50.

At all Lee dealers or from Omaha Factory.

J. F. Beverage, Athens, Ohio: "Your Lice Killer can't be beat for the extermination of lice and mites."

John W. Welch, of Omaha, the big White Leghorn man, says: "There must have been hundreds of dead lice under one roost. I didn't try to count them."

Mrs. Helmke, of Shattuck, Okla., says: "I have used Lee's Lice Killer for twenty years. There is nothing that equals it."

higher in the notches so it just barely rests on the backs of the chicks.

The chicks will not need the brooder home in the day time by now—one more advantage of the late hatching Leghorns. At night, if the night is not too cold, simply put them in their brooder and close the slide. If very cold, rarely is by now—carry brooder and all into the kitchen over night and put them out again in the morning. Keep your water fountain filled with fresh water and your mash hopper filled with mash. Every few days throw in a few finely cut pieces of raw meat. And then your troubles are over until the chicks are chicks no longer, but eight weeks old stock ready to fight their own battles. Following this method I have never seen chicks grow faster, sturdier, or better, and have never lost a single chick by disease.

On all except very cold days, raise the top roof of the coop several inches. Judge by the weather the height you must raise it.

At the end of six weeks the chicks now eight weeks old, if you have followed directions, you have a sturdy stock that has most likely outgrown their quarters or will outgrow them very shortly, and either the size of the flock reduced or a new home found. You can follow two methods: If you have the space on your city back lot, build a coop out of two piano boxes at a small cost; or you can get some farmer friend to raise them to laying age from now on. *But do not try to raise them in with your old stock.* They will not grow properly if you do so. The old birds will prevent them from having all the feed they should have and will so continually annoy them that proper growth will be impossible.

If you don't want to build a second coop try to get some farmer friend to raise them for you. They are now past the troublesome age and can take care of themselves and most any farmer will let them run with his own stock for a small consideration. They have had the correct feeding and attention during the critical age, and will grow properly from now on with but little care. I have several farmer friends in my old home county of Schuylkill to whom I send them, and whom, after I receive back the chickens at laying age I pay the market price per pound for ordinary poultry. But you do not need to do this if you have the extra coop—you can raise them yourself with practically no bother. Then you know they are well fed, too.

If you raise them yourself in the extra coop I have written of, first of all cover the floor with eight inches of the poultry litter. In this, every day, according to the number of chickens you

are raising, stir in the scratch grain. Do not stint in feed. They must have plenty, and you can not now overfeed. Plant your yard attached to the coop in oats and allow them to grow about four inches high. Put low roosts on the first floor. Move your water fountain and mash hopper over to the new coop, then the chicks. Keep them growing every day until their combs show they are approaching maturity. Then stop feeding the growing mash and start on regular laying feed. I promise you that by now you will have better health yourself than when you started, a bunch of chickens you will be proud of, and eggs in plenty. I know whereof I speak.

Turn Cheap Grain Into Poultry Meat.

Agriculture is finding that it must be more elastic. When eggs are cheap and grain is cheap, and poultry meat remains high in price, the thing to do, irrespective of what you did last year, is to incubate those eggs and feed the grain to growing chickens. In this way you will produce what the public is paying high prices for, namely, poultry meat.

On April 14, fowls in the Chicago market were quoted at 31 cents. This means that a 6½-pound roaster would return to the producer \$2 at wholesale prices.

A subscriber in Tennessee sends us a clipping from the Tupelo (Miss.) Journal which tells of Paul Pound selling a bale of cotton to J. J. Rogers & Son, of Tupelo, for \$13.60. At the same time he sold to J. H. McCarty, of Tupelo, a little bunch of chickens, fifteen in number, for \$17.60. When Mr. Pound reached home that evening he had to

fork over to his good wife, who grew the chickens, \$4 more than he received for his bale of cotton.

What do you suppose the Pounds are doing now? They are adjusting their production to the market demands, and Mr. Pound is planting less cotton and is going to encourage his wife to grow more chickens. He is starting up the incubator; or if he hasn't one, he has telegraphed for one. The manufacturers have incubators crated and at the warehouse doors, ready to have an address label nailed on them. A telegram starts the machine immediately.

Of course, the price of eggs this fall and winter will be at least twice as much as at present. Eggs are always cheap in the spring and high in the winter. Breeders of the egg-type breeds know this and they are hatching their usual quota of chicks.

Breeders of the heavier breeds, however, are finding a new stimulus in the present meat-market poultry situation. For a time it looked as if egg production was the only end for which a fowl should be kept. The present market, however, emphasizes the value of flesh properties as measured by weight. Cheap grain will encourage the breeding of the heavier breeds of poultry on the farms.

There is always a sale for market poultry, and from statistics and facts available, the market poultry situation is especially full of optimism at this time. Prices for heavy live poultry are high. Receipts of dressed poultry at the four principal centers of New York, Boston, Chicago and Philadelphia, from January 1 to April 18, 1921, are 52,840,488 pounds, against 47,914,716 pounds during the same period of 1920. Such a slight increase is not sufficient to materially affect prices.

The supply in cold storage at the same four points on April 18, 1921, was 40,414,392 pounds, against 36,617,912 pounds on the corresponding day of 1920. This small increase is infinitesimal and indicates normal consumption, although poultry meat is relatively higher than other kinds of meat.

Produce what the people want. Poultry can be grown cheaper this year than at any time in the past four or five years. Heat up the incubator. If you haven't one, better get one now.

Poultrymen Take New Positions.

Arthur G. Duston, one of the best known fanciers in the East, has accepted a position with Wm. Shands, breeder of S. C. White Leghorns, Little Blue, Missouri. This means another good grower and conditioner in the West.

Fred W. Smith, for several years associated with M. L. Chapman, Wilburtha Poultry Farms, has taken a position with Oak Dale Farms, Austin, Minnesota. Mr. Smith had arranged to go with Owen Farms, but when Mr. Delano sold his Leghorns to Oak Dale, he took a position in New Jersey with a New York banker. Mr. Smith is a young man who knows White Leghorns, and as a competitor in the show ring is fair and square.

How to Raise Chicks

128 pages, profusely illustrated. An a to z manual for everyone who keeps fowls. Written by Prince T. Woods, a man who knows how and how to teach others. price 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

OAK DALE SINGLE COMB WHITE LEGHORNS

have won most of the prizes offered at Boston and Madison Square Garden shows for the past 20 years, and they will continue to be the winners and the leaders because every Oak Dale bird will reproduce itself and, therefore, reliability exists in its breeding.

HATCHING EGGS AND BABY CHICKS. The usual and natural thing for our May and early June hatched cockerels and pullets is to go into the winter shows and win the majority of the prizes. The pullets from these matings will commence to lay about the first of December.

EIGHT TO TEN WEEKS OLD PULLETS. We offer for immediate sale a limited number of eight to ten weeks old pullets from pens 31 to 65 at these remarkably low prices: In lots of less than 25, \$2.50 each; and lots of more than 25, \$2.00 each.

The Mark of Quality

1921 MATING LIST—IT IS FREE

SEND FOR YOUR COPY TODAY.

Listed in this wonderful book of matings are about 65 pens and each headed by a bird that has won a place as a pen header by his performance as a winner of prizes.

30 Prizes Out of 30 Offered

Sweepstakes Championship Male and Female and Every special Prize—every bird bred on my farm.

This amazing record is an exact duplicate of the Imperial "Ringlet" record of 1920 at Madison Square Garden.

These 100% Perfect Records are the crowning achievement of the unexampled "Ringlet" Records at New York for more than 30 victorious years.

The competition at this show was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

Supreme at Madison Square Garden Is Supreme Everywhere

IMPERIAL "RINGLET" EGGS

MAY and JUNE are the Banner Months to Hatch Silver Cup and 1st Prize Winners

Scores of my first prize winners and those of my customers have been hatched in May and June. At the last 1921 Garden Show my 1st, 2nd, 3rd, 4th and 5th prize Cockerels, and 1st and 2nd prize Hens were hatched in May and June, and 1st and 2nd prize Cocks and 1st and 2nd Pullets in July.

My Eggs Are the Best Money Can Buy—They Produce First Prize Birds

Mr. E. B. Thompson, Amenia, N. Y.

Dear Sir: Just to let you know how the chicks have come along that I hatched out of the eggs I got from you last year. I won 1st Cockerel, 1st Pullet, and the pullet was Champion Female of the show, about 1,400 entries, so I am quite proud of my Imperial "Ringlets." The judge said that E. B. Thompson could put 125 birds in every class in any show room and all the other Barred Rock breeders in America could not get in between 1 and 125.

Sarnia, Ont., Jan. 31, 1921.

Yours very truly,

THOS. H. ROBINSON.

Grand Exhibition and Breeding Birds for Sale of This Richest First Prize Sweepstakes New York Blood. Elegant Catalog Mailed Upon Request.

Trial Package for Poultry Raisers

Here Is Your Opportunity to Prove the Merits of P.D.B. (Pure Dried Buttermilk) for Only 30c

Pure Dried Buttermilk is producing such wonderful results for poultrymen everywhere that we want every person raising poultry to prove to his own satisfaction what a splendid feed P. D. B. is. We want you to see how by our patented process we take pure creamery buttermilk and by extracting the water and retaining all its food qualities have made buttermilk available to all poultry raisers.

That's why we have put up this special trial package—to enable you for the small sum of only 30c to become acquainted with this wonderful feed—see how it promotes growth and development of your young stock—how it prevents white diarrhea—how it increases your egg production—how it shortens the moulting period—how it reduces your feed cost by completely assimilating and digesting the balance of your fowls' ration so that less feed is required.

Get P.D.B. at Your Dealer or Mail Coupon to Us

If your dealer can't supply you with P. D. B., mail coupon to us with 30c in stamps and we will send you trial package by return mail postpaid. This trial package contains enough P. D. B. to feed a good sized flock for some time. You simply add a small amount of P. D. B. to your mash ration. Full feeding directions with every package.

If you want a larger quantity and your dealer can't supply you, mail coupon at the left with check or money order for \$1.25 and we will send you our regular 5 lb. package by mail postpaid. Remember there is only one P. D. B. Don't accept any substitute. Don't take chances with something "just as good" because

P. D. B. IS GUARANTEED

We know P. D. B. will make money for you—Dried Buttermilk is endorsed and recommended by many leading poultry authorities and by state experiment stations. Prof. Quisenberry, dean of the American Poultry School, and one of the world's foremost poultry authorities, says: "P. D. B. in my opinion is the best animal protein for baby chicks, growing stock and laying hens." You take no risk—get P. D. B. today either from your dealer or mail coupon to us.

You know the old saying "You've got a horse shoe." Well you have when you breed our stock.
They Will Earn Profits Like This For You

\$650.00 PROFIT IN 5 WINTER MONTHS
Ashtabula, O., April 15, 1921
Pennsylvania Poultry Farm:

The pullets I reared from the chicks I bought of you last year started laying September 15th at the age of 4½ months. November 1st to April 1st they averaged 98 eggs per bird and are still going strong.

These 162 pullets have paid me a profit of over \$650.00 above feed costs during these five months.
P. R. CALLENDER.

You are "lucky" that you can order our record laying stock now at these 15th Anniversary Sale prices—next winter you will be getting larger egg yields. "MORE EGGS, MORE PROFITS, a hard, proved matter of fact. Glance up the left side of this horseshoe—then down the right. NO OTHER FARM THAT WE KNOW OF CAN SHOW CERTIFIED OFFICIAL RECORDS LIKE THESE, or more convincing proof of World's Champion Layers. There is none. Get your copy of our Special 15th Anniversary sale circular. A postcard will bring it. See the savings you get by ordering now—then order. Reduced prices are for a limited period only—delay of any sort may mean disappointment.

Customers can vouch for the superior laying qualities of my White and Barred Rocks, White and Buff Orpingtons, Rose and Single Comb Reds, White Wyandottes and S. C. White Leghorns. You pay 15c to 30c more for my chicks. They lay on an average of 75 to 100 more eggs than the ordinary stock per bird per year. My customers vouch for this. Is the difference in price worth the difference in eggs? Will you give 15c to 30c more for 75 to 100 additional eggs? Think it over.

Owen Farms

S. C. RHODE ISLAND REDS
and BUFF ORPINGTONS

Stand Pre-eminent

Their record as the foundation blood for other good flocks all over the World. Their show record in my hands or those of customers of Owen Farms at large and small shows all over this country and abroad. Their individual egg records in trap-nests and flock records as layers wherever they have gone. Their prepotency, stamina and vigor; and their ability to make good for their owners, have all been factors in establishing their supremacy.

The permanency of Owen Farms' business has been assured by the genuine values given, and the "Golden Rule" treatment accorded to every customer. This is the reason that many hundred orders come back each year from old customers, and why "Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism.

The 1921 Egg Trade

Has taken every good shelled egg produced that has not been set here on the Farms. Many thousands of Owen Farms chickens are growing or hatching all over the country. The average quality will be the finest ever produced. Hundreds of these youngsters will develop into winners for egg customers of Owen Farms. Hundreds more will be hatched between May 25th and July 15th. June is the month of roses and also the month to hatch Red and Buff pullets that will be in bloom and will win the large shows from Thanksgiving week on. My customers who are ordering for June delivery are wise and will have pullets just ripe for hot competition and not gone by.

Those of you who have not already ordered for delivery after May 15th will be glad you did so if you order now and take advantage of the half price rate and hatch winning pullets during June and July.

I will hatch here until July 1st, or a little later, as I want pullets for January and February showing.

Half Price Egg Sale

Commenced May 15th. Look up my mating list or my April advertisement. If you have not a copy of the list, it is yours for the asking.

Eggs from my finest matings are now \$12.50. \$9.00, \$6.00 and \$3.00 for 15. Combined sittings of Group 2 and 3 will be \$7.50 for 15.

Group 3 eggs for \$30.00 for 100, and Group 4 eggs \$15.00 for 100 are wonderful value for a small sum.

Half Price Stock Sale

Will give you fine tested breeding birds for just half their value now. You can carry them over for 1922 breeding or showing. At no other time of year will your money go quite so far in securing choice birds at a low cost. Write me your exact wants, and, if you will, the amount you wish to invest; I will write you fully and advise you to the best of my ability. See how close we can get together through correspondence. Come and visit Owen Farms if you can. If this is not possible, come to me by mail.

Farm Poultry Flocks a Source of Profit

Eggs and Poultry Are no Longer a Mere By-Product of the Farm—Better Methods of Handling Farm Flocks Are Expanding Production—Some Equipment Necessary for Success.

T. S. Townsley

THE rise of the hen from a farm animal of despised obscurity, a position which she occupied a few years ago, to one of the most highly treasured animals on the farm, as she is today, is truly a remarkable evolution. Not long since the farm poultry flock was looked upon with scorn by the average corn belt farmer. Every housewife kept some chickens and made a valiant effort to supply her lord and master with eggs for table use and an occasional fried chicken during the summer months, and usually managed to sell some eggs and chickens to buy a new dress or secure some much wanted article of household equipment. But the chickens were considered the woman's property, and the man of the house thought it beneath his dignity to take any stock in the poultry keeping operations. Consequently, on a majority of the farms little attention was paid to breeding a better type of fowls, and the birds that were kept had to shift pretty largely for themselves in making a living and finding roosting quarters.

A veteran Missouri poultry dealer says that when he first started in business a rail pen with fodder or straw piled around it was considered a good chicken house, and a large number of flocks were housed during the winter months only by the bare branches of a convenient apple tree. He states further that eggs in the winter time were an unknown rarity, and the type of poultry which found its way to the market was small, poorly developed, usually in thin flesh, and in every way undesirable.

Commercial poultry farms were indeed scarce in the central western states a generation ago, and any man who took a special interest in poultry was likely to be called a chicken crank and be looked upon as something less than a man by the hog and cattle farmers of the community.

A minister in a German settlement in Missouri says that a few years back the well-to-do German farmers in his congregation were too proud to even take the eggs to town and that they considered it beneath their dignity to have any interest whatever in the poultry operations on their farms.

In my own boyhood days on an Indiana farm I knew respectable farmers who hated

the sight of an old hen, and when they caught one in the horse trough they usually kicked her half way across the barn. Some of them were in the habit of getting up early in the morning, not because they liked to stir about so early, but because they wanted to feed the hogs before daylight so the chickens could not eat with them.

Even under the unfavorable conditions which generally surrounded farm poultry a decade ago, the farm hens played an important part in the economics of farming. Most farmers were not especially interested in bookkeeping in those days when they did not worry about an income tax and had small notions of how much revenue the poultry flock produced. A farm management survey of a representative township in southern Indiana taken in 1914 showed that the farm poultry flock even under very ordinary care was paying the best interest on the investment of any kind of live stock kept.

At the present time we seldom hear men speak of the chicken business with the derisive accent which they used to employ, but find them talking about the poultry industry in tones which show that they appreciate its magnitude. Although statistics mean but little to most of us, the figures showing the value of poultry products are truly impressive. According to estimates made by the United States Department of Agriculture, the American hen produced more than one and one-quarter billion dollars worth of poultry and eggs during the past year, thus making poultry products one of the most valuable items of income to farmers. The state of Missouri, long famous for mules and hogs, now boasts of a poultry business of approximately one hundred million dollars per annum.

The men who are keeping books on their farming operations are finding not only that the poultry flock contributes an unexpected sum to the income column, but that the poultry operations are showing a consistent margin of profit even during the trying times when farming operations in general have not been especially encouraging in their returns.

Bankers perhaps more than any other class of citizens appreciate the importance of the hen on the farm. In one Missouri county a number of

Every farm should have an up-to-date colony brooder house. This house is 8 feet wide in front and 10 feet deep. Photo taken on farm of J. E. Townsley, Indiana.

ON THE TRAIL OF THE 300-EGG HEN

The Power of Phenomenal Record Hens to Transmit Their Extraordinary Laying Power—The Super Hen from a Breeding as Well as a Laying Standpoint Has Not Been Produced.

By H. G. Forster

HAS there ever been a nation in the history of the world that has taken up all new things with as much enthusiasm as ours? If so, I fail to find a record of it in ancient or modern times. Perhaps when Rome was in the heyday of her glory she did embrace with fervor all things new, no matter what their merit.

Unquestionably this capacity for enthusiasm, and this desire to find and try out new and different methods of doing things, has contributed toward the development and prosperity of our country. I should be the last to deprecate this quality. It has helped make us the nation we are today.

But in all fairness it must be acknowledged that enthusiasm may at times run riot. In other words, enthusiasm without sound judgment may be a dangerous thing. Because a thing is new does not necessarily stamp it with merit. Without the balancing quality of good judgment much harm has been, is being, and still may be done. When our ancestors first came to this country their enthusiasm knew no bounds. The apparently inexhaustible resources were plundered and exploited. Today, but a short space of time since our yesterday, we find ourselves depleted in many of the essentials which go to make a nation permanently great. Had our enthusiasm been modified by wise judgment, much of the costly rehabilitation work we are doing would have been unnecessary today.

Fascination of High Production.

So this brings me to the trail of the 300-egg hen. Perhaps a rather devious way of getting to her, but as we shall see, quite applicable to the case under consideration. In the past ten short years the "high producing hen" has been brought to the center of the poultry stage. Today she enjoys the brilliant limelight of publicity. In our usual enthusiasm for anything new we have come to the conclusion that this precious producer is worth her weight in gold. We are constantly hearing of dams and sires, or we hear of granddaughters of "Lady Bustyou," grandsons mated to a flock of hens, the least prolific of which is laying, oh, anywhere around 279 eggs per year. What a confusion of figures. What a hectic scrambling for the possession of the latest star in the egg laying firmament! We are living in the day of "Eggomania," it rather seems to me.

Let us weigh the results with an impartial mind. Let us see whether perhaps we have not permitted our enthusiasm to gain the better of our sound judgment. We have every reason to feel proud of the advance in the art of breeding fowls for higher egg production. Today we may select with reasonable accuracy a good layer, mate her to the son of another good producer, or back to his mother, and produce splendid chicks. Unquestionably the elimination of the "non-producer" in the better flocks of our country is rapidly raising the laying standard of our hens. To the late Walter Hogan, plus the valuable work done by many other poultrymen, as well as agricultural colleges and experiment stations, we owe a wealth of reliable data on this subject that cannot be overestimated.

Breeding Power Should Not Be Sacrificed.

But—and here is the rub—we have permitted our enthusiasm for and admiration of the phenomenal layer to cloud our sound breeding judgment. The value of such a hen lies, not so much in the actual number of eggs she may lay in her pullet year, but in her ability to transmit her superlative qualities to her offspring. Shall we be frank? Just for once let us push the glamor and, I was almost going to say romance, to one side and look facts straight in the eye. How many 300-

egg hens do you, or I, or anyone else actually *know* to have proven themselves to be phenomenal parents? In the first place, the only records we may take with absolute safety are the official ones. No one doubts the records being made by a great many truthful and reliable poultrymen. But we find that only official records are given both official and country-wide recognition. I happen to know of several hens who have produced a very large number of eggs per year. They may be classed as phenomenal layers. Are these hens laying eggs that hatch well, and are bringing phenomenal layers into the world? Or are perhaps their daughters doing as well, or their sons the fathers of as high producing stock? I wish I could say "yes" to every question asked. But in truth I cannot. I do not mean, of course, that high producing hens do not or cannot transmit their qualities to their offspring. The percentage, however, is small. I challenge the owners of hens with official records ranging from 275 to over 300 eggs per year to show a large number of offspring as good or better than their mothers.

Nature works "in strange ways her wonders to perform." How many men or women in history, who have stood head and shoulders above their fellow men, have been the parents of children capable of performing equal feats of intellect or skill? Where do we find the world-famous singers, painters, authors, musicians, or other lights, the children of whom are as talented or as clever as they? Not many, we must admit. Some, to be sure, but they are the exception which prove the rule.

In other words, there is a certain cycle of development in all of the workings of nature. Most of the greatest geniuses in history sprang from parents of medium, or at least not phenomenal caliber. Few came from parents as great as they. There is a rise and fall in all families, races and nations. The beginnings are usually modest, and gradually through refinement and breeding—if I may use the term in this connection—greater efficiency or approximate perfection is gained. Then a high point is reached, and a recession takes place.

All of these laws apply in great measure to the phenomenal layer. She is often the product of good but comparatively lowly parents. She is seldom the offspring or the ancestor of a long line of great layers. Think how this would have worked out if we could build with certainty and produce definite breeding results. There is enough good heavy milk producing blood in this country to have made our cows a race of super cows, had their ancestors been able to transmit their desirable qualities in large measure to their offspring. There are enough Tom Barron and Lady Eggplant strain males and females, plus other high producing offspring in this country, to have made everyone of our commercial hens a "200-egger" or more today.

Great Leaps of Progress Do Not Always Hold.

Let us therefore be reasonable about this egg-laying business, and recognize the fact that the phenomenal layer is by no means always the most valuable in our flock. Unquestionably far too much stress has been and is being laid upon the highest producers of a flock and not enough attention given to the general average, coupled with their ability to lay a goodly number of eggs per year, produce good hatching eggs and strong chicks. This, after all, has been and must remain the solid, reasonable foundation upon which the poultry industry can prosper.

Please do not gain the impression that I would stop breeding for better production, or that I would arbitrarily discard all highest producers. Far from it. Let us continue to improve our flocks by sane and skillful breeding methods. Let us eliminate by all means the poor producers, and let us keep only good layers. But do not let (Continued on page 670)

Comment on Proposed Standard Changes

"Where there is much desire to learn, there of necessity will be much arguing, much writing, many opinions; for opinion in good men is but knowledge in the making."—*Milton*

White Wyandotte Type.

By CHARLES NIXON.

IT IS an undisputed fact the text of the present Standard is absolutely misleading in setting forth Wyandotte type as per the ideal. It is true that Wyandottes need a medium length to back and shank but not thigh. If the thigh is lengthened or rather if breeders try their skill in lengthening the thigh, we will have a lot of birds on stilts. All breeders who have a line of birds that have been bred to the point of reproduction know full well how easy it is to get those long thighs, and to my way of thinking it is a section that should not be changed from the word "short." A lot of people use the expression "long-legged" when the whole trouble is in the thigh. I favor "medium length" in both back and shanks but not thigh.

Then, too, the present Standard calls for a short tail. Of course we do not want a long tail on a Wyandotte, but in conforming to the proposed change of medium length of back and shank, would it not be well to add "medium length in tail"? In changing certain sections all sections having to do with that particular point should be considered in order that the specimen shall be truly symmetrical.

The ideal you will note is just as long from front of breast to base of tail, as from the base of hackle, or shoulders, to the bottom of body line. This will allow room for a medium sized egg to lie lengthwise in the back, which, to my mind, is correct for length of back. You will find this exact type in 95 percent of the winners at the New York and Boston shows and regardless of the changes that take place in the new Standard, it is the type that we are striving to find words to express correctly, and will be the type that will continue to win till time is no more.

There is another mighty important section that should have consideration and that is the fluff. The present text calls for the fluff to be full feathered. A lot of breeders interpret this to mean all the feathers possible. To my mind the fluff section should read: "Fluff medium full feathered not to stand out so far as to appear Cochiny." This will not only aid in elucidating the text but will be a big factor in egg production as well. Facts are Wyandottes do not want to carry a heavy fluff, but to the contrary a medium hard feather that does not protrude beyond the line of the wing-bow. I think this section should have due consideration as it is a section that makes or breaks an otherwise good specimen, both in the show room and egg production.

After all, the changing of the Standard is a mighty serious thing and a matter that should have thought and then serious thought. A man or a set of men may be breeders, or publishers of poultry magazines, writers of great ability, etc.; they may have bred successfully a certain variety of fowls, but when it comes to making changes in the Standard of Perfection that have to do with certain varieties that other breeders have spent practically lifetimes and thousands of dollars to bring to the present stage of perfection, then those that have made possible the best in the several varieties in question should have a big say in a matter that is going to make or break that which they have labored long years to bring to the front.

The "nigger in the fence" is wholly and solely the utility question. There is not a breeder of any note today who would tolerate a strain of fowls that would not produce eggs—that is essential, and I want to go on record as claiming that the White Wyandotte bred to the present ideal and winning at such shows as Madison Square Garden and Boston will lay equally as well as any so-called utility Wyandottes on earth, and breeders do not have to breed two distinct lines to accomplish this result. The thorn in the flesh is the exag-

gerated egg records that are broadcasted throughout the land. The Standardbred Wyandotte of today always has been a good layer, is today and always will be; it is bred right, and is a business bird as well as the most beautiful.

Maintain the Dignity and Prestige of the Standard.

By FRED H. BOHRER, Secretary, American Cornish Club.

The editorial in May A. P. J. certainly strikes the nail on the head. I dare say that not many editors would have the backbone to come out with facts as you have done.

Keep up the good work. I am sure that the bulk of the American fanciers are fully in accord with your ideas towards keeping the Standard on the high pedestal that it deserves, and not letting it become a cheap lot of printed pages filled with "How to Build Hen Coops Out of Piano Boxes," etc. I congratulate you on the stand you are taking.

Where Do We Go From Here?

By THEO. HEWES.

We have been traveling so fast since the Kansas City convention of the American Poultry Association that one cannot but stop sometimes to ask himself the question, "Where do we go from here?" The so-called Committee of Forty seems to think they were granted unlimited license to do, or not to do, any old thing that struck their fancy. The framers of the resolution which brought this committee into existence were wise enough to know where they were headed, and the sop thrown to the convention of the members of this committee doing all their work for sweet charity sake put over the resolution. But do not think that we have reached the point in A. P. A. affairs where men are going to travel all over the country and do work for nothing unless they have a personal ax to grind.

If the members of this committee are better qualified to revise the Standard than the men whose duty it is to do the work, then discharge your Standard Committee and let the Committee of Forty do the work.

I was wondering if I, in my old age, had gotten so far behind the times that I was standing alone in my opposition to this big committee; if I was really a "has-been" and could not see progress when I met it face to face. The editorial in the May issue of the American Poultry Journal entitled "The Fate of the Standard," showed me there were others who held views similar to my own on this important subject and were not afraid to express them.

I have no doubt the suggestions offered by the big committee are being offered in good faith, and that the committee believed they were doing the right thing in framing up a new text that would set the world right on a very important phase of poultry culture. They have seen a few demonstrations of some of the utility wizards in a dark room, and they have convinced themselves that the dead really come back to borrow a chew of tobacco from the living; but they don't.

If the Standard means anything, it means a Standard of Perfection, not a Standard of Guess. If we are going before the public with a book that is to be a guide for breeders to breed by, and a Standard for judges to judge by, then it must be built on lines that we know are correct. By no stretch of imagination have the utility breeders reached a point where they can honestly say that they have attained to perfection. They have done much, and are making progress, but they have not reached perfection by any means, and the men who are doing the most and saying the least, know this.

I have no intention of bringing names into this article, but there are some things that should (Continued on page 671)

HOW TO BUILD A POULTRY HOUSE

Bill of Materials for a 25-Hen House—Anyone Handy With Tools Can Erect a Substantial and Serviceable Building—Lumber Used Should Be Thoroughly Dry So That It Will Not Shrink or Crack.

By F. A. Merrill

IN BUILDING new poultry houses for this year's work the essential points to keep in mind are fresh air, sufficient sunlight, dryness, and space enough to house the birds comfortably. The type of house to be built is not so important as long as it is one that gives adequate protection under your climatic conditions. The house suitable for the north will do for nearly any section of the country, with the sole modification that it should be built in a more open manner if used in the south.

At least four square feet of floor space should be allowed for each occupant of the house, as this will permit sufficient air and at the same time conserve the body heat thrown off by the fowls. Further fresh air may be secured through ventilation rather than by increasing the floor space. When the birds can stay out-of-doors most of the day and nearly every day in the year, floor space may be materially reduced.

Colony houses should not house more than twenty to thirty hens, as it is inconvenient to move houses built for a larger number of attendants. If a long, permanent house is used, a far greater number may be accommodated.

For simple, rough structures, common unplanned boards 1 inch thick may be used, battens being placed over the cracks. The boards should be as wide as possible, as this lessens the amount of battens required and decreases somewhat the cost of labor. Any durable lumber which is readily available is suitable for use. The building material should be well seasoned, or serious cracks will occur in the walls, due to shrinkage; frequently these cracks will become too large for the battens to cover. As lumber comes in even lengths, 10, 12, 14 or 16 feet, care must be used in making out the bill that the amount of lumber ordered will cut to the required lengths with the least amount of loss. The following is a bill for lumber sufficient for a house to accommodate twenty-five birds:

2 pieces 4x6, 12 feet long, for sills.....	48 bd. ft.
3 pieces 2x4, 14 feet long, for joists.....	28 bd. ft.
3 pieces 2x4, 16 feet long, for rafters.....	32 bd. ft.
13 pieces 2x4, 12 feet long, for studs and braces....	104 bd. ft.
340 sq. ft. 7/8-in. matched flooring for floor and sides	340 bd. ft.
100 sq. ft. 1-in. sheathing for roof.....	100 bd. ft.

Also 1 roll of roofing paper, 2 window sashes, hardware, etc.

In place of the matched flooring plain boards 1 inch thick may be used. If this is done, sufficient battening must be ordered to cover the joints between the boards used for the walls. Battening should be at least 2 inches wide and preferable 3 inches wide. The lumber bill quoted above will build a house 10 feet long, 7 feet wide, 6½ feet high at the front and 4 feet at the back.

Constructing the Building.

In constructing the framework of the building the sills should be placed on stones or posts. If cement supports can be constructed without too much trouble and expense the gain will be worth attaining, if only in lasting qualities. The floor of the house should be at least a foot above the ground. If cement floors are made, they should be built directly on

the ground, but of sufficient height and slope so that proper drainage may be obtained.

Whatever kind of foundation is used should be started below the frost line in the ground. If either stone or wooden supports are erected they should be placed from six to eight feet apart and should not be less than 6 inches in diameter. The foundation must be securely and properly constructed if the poultry house is to give the best satisfaction. The sills used may be 2x4, 4x4 or 4x6, according to the weight and size of the house desired; the smaller sills being heavy enough for colony houses, while the heavier ones must be employed in the centralized houses and those that are to have two stories. The floor joists for the wooden floors should be 2x4, 2x6 or 2x8, according to the size of the sills used and the amount of weight the flooring is expected to carry. Joists are generally set 18 inches apart and braced with short cross-pieces when the weight to be supported is unusually great.

Care should be taken to see that the floor is perfectly level and that the corners are square.

When the studding is erected it should be plumbed with a level for the length and the width of the house before being securely fastened to the sills. After the studding is erected it should be braced until the house is sheathed. Studding to be used in most poultry houses is set from two to four feet apart, except where the windows and doors are placed. On the sides where these are used, the studding is set to conform to the window and door openings. Corner studs are made by splicing two of the wall

Growing chickens need plenty of air. This 3x6-foot coop is a good type of "growing house."

studs together. Studs should be either 2x3 or 2x4 inches in size, according to the type of house built. The wall plate is generally made by spiking two pieces of the studding together and fastening it securely to the top of the wall studs.

The roof rafters are made of 2x4, 2x5 or 2x6 lumber. The first size is used only for the smaller houses, the second for the larger houses, and the last for the houses where the roof has to sustain excessive weight, as heavy snows during the winter months. If the rafters are over 14 feet long they will have to be braced in order to keep them from buckling. To do this a piece of lumber 2x6 or 2x8, set on edge, is placed lengthwise of the house at the roof level half way between the front and back walls.

In the colder sections of the country it is sometimes necessary to use building paper in the construction of the walls. Where this is necessary the walls are first sheathed diagonally with ordinary lumber and then covered with a tarred paper or a regular building paper used for keeping out the cold. After the paper has been placed over the sheathing, the walls are covered with shingles or clapboards. A good quality of siding placed directly over the studding is generally satisfactory for southern hen houses. A cheaper construction would be to use unmatched 1-inch boards against the studs, covering the cracks between the boards with 2 or 3 inch battens.

The Roof and Floor.

The roof rafters should first be sheathed with unmatched boards and then covered with the roofing paper or shingles. Roofing paper is more generally used for this purpose than

shingles, as it is cheaper and better adapted to the flat roofs of most poultry houses. Roofing paper comes in rolls containing 100 square feet of surface covering and may be used safely on a roof that has a rise of only 1 inch to the foot. When roofing paper is used the sheathing of the roof should be planed on the upper side and should be laid as closely together as possible, so as to present a comparatively smooth surface for attaching the paper. If shingles are used, open sheathing should be placed on the roof and the shingles laid 5 inches to the weather. This exposure should be given on the

These colony houses are 10 feet wide in front and 7 feet deep. A hood in the center of the front may be raised in warm weather. Photo taken on poultry farm of U. S. Department of Agriculture, Maryland.

walls, too, if shingles are used on that part of the house. Shingles will not work well on a roof that has less than a one-third pitch.

The kind of floor to be used in the poultry house will depend somewhat on the type of soil where the house is to be placed. If this is sandy and well drained, a natural dirt floor may prove satisfactory. Such a floor should be two or three inches higher than the surrounding ground, to insure proper drainage. However, there is the constant danger of the dirt becoming contaminated with droppings, and in building a new poultry house it will pay to lay a floor. Rats may be kept out of the poultry house by placing a $\frac{3}{4}$ -inch mesh wire below the dirt or wooden floor. A good concrete floor may be constructed by using 1 part cement (2 bags), 2 parts sand and 4 parts gravel (rather coarse) to 10 gallons of water in mixing. If the flooring is coated with 1 part clear cement and 1 part fine sand, a smooth surface will result. Whenever cement floors are used they should be heavily coated with litter, as they are generally too damp for the best health of the fowls. A layer of tarred paper is frequently placed between the stone foundation and the concrete to prevent moisture from penetrating the floor and making it damp.

Too much glass ought not to be used in building poultry houses. A very large glass window in the front of the house makes it very warm in the daytime and very cold at night, as glass radiates heat rapidly. If curtains of unbleached muslin or of duck are placed across the window in the front of the house they will help to keep the temperature more even. The cloth should not be too thick to interfere with the circulation of the air and should be thick enough to act as a protection against too rapid radiation. The front window should be high enough so that sunlight passing through it in the winter time will penetrate well toward the back wall.

The Furniture.

The interior furnishings of the house should be simple and not costly. They should be portable, that there may be ease in cleaning. Roosts should be placed at the back of the house about 10 inches above the dropping-boards. These boards should never rest on the floor, but should be raised from it some two or three feet. The roosts should all be at the same level, as hens will fight to get the highest spots for sleeping. The roosts can be made of 2x3 or 2x4 scantlings with the upper sides rounded and smoothed off. All roosts should be smooth for protection to the hens. Hens require from seven to ten inches of roosting space. The scantlings used for roosts may be placed 12 inches apart, although many poultrymen suggest 15 or 18 inches as being the better distances.

Nests are often placed under the dropping-boards, where

they will be out of the way and not take up any floor space. Some poultrymen feel that this makes the space under the dropping-boards too dark, and they prefer to hang the nests on the walls. Wherever they are placed, they should be so arranged that the birds can get to them easily. They should be about 14 inches square and 16 inches high, with a strip about 4 inches high along the open side to prevent the nesting material from coming out. When careful breeding is undertaken, trapnests are very essential. There should be at least one nest to every four or five hens.

Poultry houses may be preserved and protected by a good coat of paint. Ready mixed paints suitable for covering the houses can be obtained at any paint supply store, or the necessary pigments may be bought and the paint mixed at home. A priming coat should be put on the house before the paint is used, as this will add to the lasting quality. Equal parts of the paint to be used and linseed oil made an excellent priming coat. After the primer is put on, the house should be covered with at least two coats of the paint.

If whitewash is used, a satisfactory solution can be made by taking about ten pounds of quicklime to two gallons of water. The lime should be put in a pail and the water added, when the whole substance is covered with burlap and allowed to slake for an hour. After thorough slaking has taken place, enough water should be added to make the whitewash of the right consistency. The inside of the house should be painted with this solution, even though paint is used on the outside. It makes the house brighter inside, for it is well known that white walls will reflect half again as much light as natural wood colored walls. A waterproof whitewash may be made in the following way: Slake 1 bushel of quicklime in 12 gallons of hot water; dissolve 2 pounds of common salt and 1 pound of sulphate of zinc in 2 gallons of boiling water; pour the latter solution into the quicklime and add 2 gallons of skim milk and mix thoroughly. The whitewash should be put on the house with as broad a brush as can be conveniently handled.

There have been people who would not enter a poultry house, saying that all hen houses were infested with lice. This is not true. A person may sit down on the straw litter in a well kept house and not get a mite on him. Whitewash, liquid lice paint or liquid disinfectant are necessary to combat the mites which live in poultry houses. Recently a syndicated article was published in country papers to the effect that the United States Department of Agriculture had examined thirty-one different lice paints and found them largely ineffective. That is misinformation of a harmful nature. Every poultryman knows that lice powder is used to control body lice on chickens, and that the purpose of lice paint is to control not lice but mites which live in cracks and crevices of the hen house and only go on the body of the chickens at night to suck blood.

A row of small breeding houses on the plant of a fancier who keeps a large number of different varieties.

A great deal of interest is being taken in double-story hen houses in which the attendant does not enter. Fanciers who enjoy their chickens prefer a house that they can enter, and, closing the door, pick up, examine, pose and pet their chickens. Such a building may be built at small expense by anyone handy with tools, using second-hand lumber and covering the same with tar paper. One of the greatest pleasures that the fancier has is derived from being with his chickens. A fancier is therefore a home lover.

DEVELOPMENT OF SILVER WYANDOTTES

From an Obscure Beginning the Silver Wyandotte Has Been Developed Into a Most Beautiful Fowl—The Variety Is in the Hands of Studious Breeders—Aims and Ideals of These Breeders. *By J. H. Drevinstedt*

THE color pattern of the Silver Sebright bantam is a most attractive one. The large oval white centers with very narrow black lacing around the feathers, in all sections of the male and female, produce a harmonious blending of beautiful lacing found in no other race of poultry. Sir John Sebright, who originated the famous bantam bearing his name, set up a very high ideal in color markings which he and other good fanciers spent years of labor and patience to attain. No breed or variety, large or small, will inspire the admirer of fine feathers more completely and strongly than the Sebright bantam, for the obvious reason stated above. It is no wonder, then, that the founder of the now popular Wyandotte race of poultry started out with the Sebright color pattern in mind as his ideal for a new American breed.

Origin of the Wyandotte.

John P. Ray bred what he called the Sebright Cochins at Hemlock Lake, N. Y., in 1868, which became known as the American Sebright shortly after that date. George F. Hull, of New Lebanon, N. Y., obtained his first American Sebrights in 1872 from an aunt who discovered them at Sand Lake, N. Y. Where they originally came from has never been authentically established, although pages have been written regarding the crosses which were made in the incubating period and transition stage of the breed.

Sebright Cochins or American Sebrights were advertised as such as early as 1875. The American Poultry Association declined to recognize the new breed when its sponsors applied for its admission to the Standard of Excellence in 1876, the chief objection being to the name "American Sebright." In 1883, however, the new breed was admitted under the name of Silver Laced Wyandottes, which full name it retained until the Silver Penciled Wyandotte appeared on the scene, when it became known as the Silver Wyandotte, a name which has been approved of as most satisfactory to breeders and fanciers throughout the world.

In 1874 the late B. N. Pierce, of Indianapolis, Ind., one of the noted poultry judges, writers and artists of his day, made a drawing of a pair of "American Sebrights" which became the accepted ideal of many breeders. On page 661 is a reproduction from the original cut which first illustrated the completed type of the now well known and popular Silver Wyandotte.

The picture was made for L. Whitaker, of Michigan, a

noted breeder of that early period, and reproductions of it were used by other breeders for a number of years after, to illustrate their catalogs and advertisements.

The type and color illustrated were the original conception of the breed for both shape and color. The cock's wing approximates closely to the modern ideal in color, although the wing-bar exhibits too few laced feathers. The hen's back and cushion are mossy, but that was a characteristic of the earlier Wyandottes which the old Standard tolerated. It is a characteristic of many good cockerel-breeding hens today. The large open centered breast feathers in both the cock and hen are not far removed from those of the modern specimens. The body proportions are a fair reminder of the type or shape of the earlier Wyandotte.

After nearly fifty years of breeding to extreme or false color standards at one time or another, the Silver Wyandotte has finally settled down to the so-called Sebright type of lacing in its color markings, modified or intensified to fit the larger breed's feathers and the more distinctive color markings characteristic of the male.

The Modern Laced Bird.

It was, however, this very natural and laudable, albeit difficult, if not dangerous, striving after the color pattern of the Silver Sebright bantam that confused many breeders and retarded the progress of the breed. Had the strongly defined color pattern of the Silver Laced Polish been accepted as an ideal in color markings, the chances are that more rapid and satisfactory progress would have been the result. The very narrow black lacing and large white oval centers of the Sebright bantam feathers fit the smaller breed, the tightness and smallness of the feather intensifying the black. In the larger and more loosely feathered fowl, the wider and longer feather demands a heavier black lacing in proportion to the greater size of the white centers. To insist on the very narrow Sebright pattern would eventually result in grayish instead of black lacing. This has been the experience of Wyandotte breeders who have tried to breed with that object in view but failed to obtain the desired results.

The present American Standard of Perfection has done much to improve the color pattern of the Silver Wyandotte, and, judging by what experienced breeders and exhibitors say, it is the most satisfactory standard for the breed or variety ever constructed, and should remain in force in the future as it has since 1915. I will add that one of England's leading breeders of Silver Wyandottes is of the same opinion.

The greatest progress has been made on the female side, more uniformly open laced pullets and hens with clean white centers now being bred and exhibited. This great improvement can be traced to the introduction of English Silver Wyandotte blood, as well as to mating up pens that will produce exhibition females only.

Value of the English Blood.

To John C. Jodrey, formerly of Danvers, Mass., but now residing in London, England, much of the credit is due for introducing the English Wyandotte blood into this country. But Mr. Jodrey, after several years of experimenting, soon discovered the fountain-head for good English Silver Wyandottes in the yards of J. M. Philipson, the most successful breeder in England.

It was in November, 1912, that I wrote to Mr. Jodrey at Danvers, Mass., for information

Pullet-breeding Silver Wyandotte Male, bred by J. M. Philipson, of England.

First Prize Silver Wyandotte Cock at Madison Square Garden, bred by Dr. T. H. Charnbury, of Pennsylvania. This is a typical American male.

Sample feathers plucked from wing bows of five English-bred Silver Wyandotte hens. Feather at extreme right has poorest white center, same being almond shaped. Feather at extreme left is best all-round feather. Black ticking in white center is a common defect in the backs of hens.

regarding the early history of his Silvers and the value of the English blood when infused into American-bred stock. On November 12, 1912, I received his reply, but did not at that time deem it expedient to publish same, as Mr. Jodrey was still an exhibitor and competitor at leading shows. Since his retirement from the field of action, the following data from his letter may prove of historic interest:

"I first bought Houdlette stock, but got no good results. Next I bought of Charles Cooper, of Salem, Mass., and my memory says that he said he was breeding Hull & Whittaker stock; but I don't know who Hull was. I plugged along for ten years, breeding very large and fine looking birds that were most remarkable layers. I got 600 eggs from 30 pullets in January, and about the same in February. This was about 1885 or 1886. As I remember it now, some of the cockerels were of high station, large and of good type.

"About 1894 I tried Houdlette again on eggs and got some good foundation stock. I improved these birds and in 1897 imported my first stock from Boadin and Thomas, of Cornwall, England. With these birds I improved the lacing and brought out at the Boston show the first laced wing-bar I had seen, and I don't know but the first in the country. F. L. Mattison had imported a cockerel, but he told me that he bred him with indifferent results. I showed some of these pullets at Amesbury, Mass., and got a score of 95 and 96. At Boston you gave me first and second, over Mr. Mattison, and second pen. The cockerel was high on legs.

"Since then I have used nothing but English stock. Not that I did not try our home stock, but never could find any that would help me a bit. Since introducing English stock I have carried the old native line along for males.

"As to white sports, I hatched them as early as 1885, but many more such after using English stock. This year I hatched about 15 percent. Some of the very best Silvers I ever owned, those with dense black and clear white, have produced three times as many sports as those that were lighter. I don't like to see sports, but when the time comes that we do not get them we will not have such good lacing on the Silvers. I don't think the English stock bred pure will breed more sports than our native stock, but when crossed we get more.

"One thing more. I firmly believe that we cannot produce Standard-shaped Silvers and get the same good lacing in them such as the English get in their type of birds, and I find that my sentiments are shared by the English. Surely I have had a chance in sixteen years to test it. Occasionally we get a bird of good type and good lacing, but that is the end, and I have not been able to reproduce her like from herself. So I think that in time we will have to content ourselves with a modified type of the English, if we want to hold the beauty of the lacing."

Aside from the earlier English type of birds, which no American breeders of Wyandottes favored, all breeders will acknowledge that the improvement in lacing made by the fanciers of England is beautiful. But this has been brought about by an entirely different system of mating than the originally employed by American breeders. To Standard laced females the English breeder does not look for an exhibition male with black striping in the hackle and saddle feathers and silvery top color to mate with the pullets or preferably clean centered hens. He wants a cock or cockerel laced on back or saddle and pullet laced on wing-bow, breast and body, free from white edging as possible, while the hackle may suit him best if it is smoky in appearance. From such a mating exhibition males cannot be produced. The greatest trouble with some American males today is that English blood has gone into many

yards and breeders persisted in trying to breed exhibition males from this mixture of blood, with the result of loss in silvery top or surface color due to smut on hackle, back and saddle.

American Silvers Produce Best Males.

There is no other blood that will produce the fine hackle and saddle striping and silver top color, if handled intelligently, like that of the true American Silver Wyandotte. It may be that some of the males appear brassy, but this can be bred out by proper selection. Mr. Jodrey expressed the opinion several years ago that he never crossed the two lines. He bred the English stock nearly seventeen years, but never gave up his old native line and never crossed the two lines, except for the production of females or to secure better shape. He claimed then, as he claims now, that open and uniform lacing on females, and freedom from edging, cannot be produced from a Standard exhibition male.

To separate the two lines, breeding one high class silver topped male to properly selected, strongly laced hens, with clean well striped hackles, in order to produce exhibition cockerels, and breeding the less desirable male, so long as he is laced on back saddle and wings, with breast lacing free as possible from white edging, and hackle lacking a distinct stripe, to clean centered hens, uniform exhibition pullets will be the result. It is the middle of the road which leads to success in breeding Silver Wyandottes.

The attempt to change the hackle and saddle striping of the Silver Wyandotte male to a laced feather in both sections did not meet with favor from old experienced breeders. No doubt the men who made it, more as a suggestion than a demand, did so from unselfish but mistaken motives. A hen feathered Silver Wyandotte may be a necessity in the breeder's yards, but in the showroom would prove a freak. To change from a striped hackle and saddle to a laced one, would result in producing high class females, but at the expense of the males. The characteristic and beautiful striping in both these prominent sections will disappear and the foreign white color will again crop out in the tail and flight feathers, together with a smoky surface over neck and back and wing-bows—which are never seen in males from correct matings under the present Standard. Instead of a bright silvery topped male, a wasted-out, smoky looking scrub will take his place.

It will be interesting in this connection to quote from a letter written by the noted English Silver Wyandotte specialist in reply to our request for his views on the proposed changes in the Wyandotte Standard. Mr. Philipson, under date May 17, 1920, writes as follows:

"When you get a good laced saddle, it gives a dark topped appearance, and to get well laced saddles they are nearly always heavy in lacing on breast and not clean from shoulder to wing-bar. I consider the old Standard cannot be improved upon, and I for one would resist the change to the

(Continued on page 660)

Five breast feathers from same five imported English-bred Silver Wyandotte hens, reproduced by courtesy of Dr. T. H. Charnbury, Pennsylvania. Center feather has the best oval center, also intense black lacing. Weak edging that does not lace around the feather is a common defect in the breast section of females.

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

Selling Eggs by Weight

Selling eggs of full size, as measured by the scales, is attracting wide attention. Buyers have been very selective this year, and prices have been shaded on small eggs to keep goods moving. Only large, heavy eggs have been bought for storage purposes.

This matter of size has been carried into the retail trade. With eggs selling by the dozen, competition in the retail trade often becomes unfair. One store, for instance, may advertise eggs at 31 cents a dozen; another store in the next block may advertise "fresh eggs, 28 cents." A visit to the two shops reveals that the 28-cent eggs are fresh, but a 30-dozen case of them would weigh only 52 pounds, whereas the 31-cent eggs are out of a 55-pound case.

The result is that the merchant who is honestly desirous of giving full egg weight and not merely full egg count, is handicapped because he has no effective way in which to advertise the fact that his eggs weigh 24 ounces to the dozen and not 22 ounces.

Because of this condition in the retail egg trade, Hillman's, a big retail store in the downtown district of Chicago, has started to sell eggs by weight. The idea has taken on and at the end of the third week this store is selling one hundred 30-dozen cases of eggs a day. That is equivalent to 18,000 dozens a week. The entire trade is "cash and carry." G. J. L. Janes, who has charge of the food department at Hillman's, says that he believes that their trade will soon be paying for and carrying out of the store 30,000 dozens per week.

For three months Hillman's sold eggs on a quality basis. They hired their own candlers and carefully graded the eggs so that every dozen would be a 24-ounce dozen. The sales grew gradually. Then Mr. Janes developed the idea of selling eggs by the pound so as to drive home the fact that they were selling eggs that had big shells and full contents. He ordered a large supply of eight-egg cartons on which he had printed in big letters, "8 to the pound."

That means a 2-ounce egg. Mr. Janes also has cartons

labeled one pound and a half, which hold one dozen 2-ounce eggs. When eggs are 30 cents a dozen, the price of a one-pound carton is 20 cents; the price of a pound and a half carton is 30 cents.

Mr. Janes employs three candlers to sort and pack the eggs. The small eggs are used for manufacturing purposes in Hillman's bakery. The bakery uses only fresh eggs, and not frozen or dried eggs, so the plan of selling eggs that weigh full 24 ounces to the dozen works no hardship on the store.

As long as the producer is obliged to sell his eggs by the dozen, he will have no special incentive to increase the size of his eggs; and as long as eggs are retailed by the dozen, the purchasers will have no protection against small eggs. Eight eggs to the pound will advance the interests of the industry and increase the sale of eggs.

Boys and Chickens

As we went home the other evening we chanced to pass some boys chasing a rooster in a vacant lot. Very likely they had got tired of playing ball, and, seeing the chicken, their impulse was to run him.

These boys did not realize how much pain and distress they were causing the frightened rooster. They had not been taught practical kindness toward animals, for there were no animals around their homes with which they could become acquainted.

They had no idea of the pleasure they would derive from an intelligent study of the same terror-stricken fowl. They had not been brought up face to face with nature. Their homes were suites of rooms in apartment buildings, around which were no trees, or vines, or plants, or animals. The best illustrations in their school-room studies were only shadows of real nature.

These boys had not fully comprehended that homes today were possible because early man had domesticated animals, protected them, fed them; and then cultivated plants by means of animal power. It was that important step in the progress

of early man that transformed wandering tribes into stable communities, and started the human race in that development which has culminated in modern civilization.

How much better fitted for life are those boys who early learn to understand something about nature and the fundamental relation of nature to man. That knowledge is not superficial, but lies close to the heart, and to the home and to all that makes life broader and better.

It is too bad to see boys growing up in the cities without ever planting a garden or setting a hen and thus bringing forth into the world a new generation of plant or animal life. Boys who travel the devious streets of a great city in gangs are the fruits of too artificial a system of growth and education.

Reprinting the Other Fellow's Material.

There is a high regard among poultrymen for the rights of other breeders. Occasionally some new and inexperienced breeder, through ignorance of established custom of fair play, appropriates to his own use reading matter or illustrations that are the rightful property of another breeder.

Just recently, J. I. Lyle, proprietor of Jill Farm, detected that the pictures of his first prize White Orpington hen at Philadelphia, 1919, and his first old pen cock at New York, 1920, also the pictures of J. S. Greenshield's first White Orpington cockerel and first pullet at New York, 1919, had been reproduced by a breeder in Alberta, Canada, the cuts being used in a circular and fraudulently labeled to represent winning birds at Western Canada shows.

Another case of this kind was brought to our attention this season. A young breeder of Rhode Island Reds in Missouri issued a mating list in which he reproduced from the Standard of Perfection the copyrighted pair of pictures of a Rhode Island Red male and female. We had planned to run a good sized ad for this breeder in the pages of the Journal, but upon receiving a copy of his mating list we canceled the ad and it did not appear in these columns. The American Poultry Association is now investigating the matter with a view to protecting the association's property rights in its Standard illustrations.

The poultry public also has an interest that should be protected. A fraud is perpetrated on the public when unreal and deceptive pictures are used to illustrate the quality of birds that a breeder has. If the Red breeder in Missouri or the White Orpington breeder in Western Canada had birds that approximated closely to Standard type, there would be no need for them to reproduce high class pictures, to the use of which they had no moral or legal right. On this point of misrepresenting quality by the fraudulent use of pictures that represent more quality than the seller actually has in his breeding yards, Mr. Lyle says: "I do not complain of the use of my cuts, but I do care about them being labeled by another breeder as his own birds, and his winners at western shows, which would not have a chance in the world if in competition with the birds which he illustrated. I do not express any injury to myself. The injury is to the people to whom he is selling birds."

Mr. Lyle further adds: "The breeding of chickens, which has attracted by its singular fascination men of all creeds and nationalities, has been remarkably free from fraud and deception. This has been so, I think, because of the pronounced element of sportsmanship, the keen sense of rivalry, that are a part of the game itself. Because of this fine sportsmanship which has always characterized the conduct of breeders, especially those who exhibit, it is more than lamentable to discover a fraud."

County Agent or Home Adviser?

Who is to do the poultry extension work in the counties, the County Agent or the Home Adviser? This question has been raised by women advisers who have realized their limitations along livestock lines, and being too imbued with their own science to admit a deficiency in its attractive and helpful qualities, have honestly wondered whether they should under-

take the fascinating poultry work, or having undertaken it, how far they may safely go in developing a poultry project.

This matter is ably discussed in this issue of the Journal by W. H. Smith, associate professor of Animal Husbandry, University of Illinois, and we are glad to be able to present so mature an opinion on a question that has arisen only recently with the development of home bureaus within the county farm organizations.

That the farm women are keenly interested in poultry problems is apparent to anyone who has attended a rural community meeting. Once the subject turns to chickens, immediately there is a general discussion.

The income from the sale of eggs and poultry on the farm have traditionally gone to the wife and been largely used by her in purchasing things for the home. It follows that the home advisers are naturally interested in a source of revenue that has done, and will continue to do, so much to make possible a fuller and better home life on the farm. It is with a desire to increase this income, and introduce methods that will expand poultry production, that many of the women home advisers have adopted a poultry project and then set about to qualify themselves to give instruction in poultry feeding, housing, diseases, and in a number of instances have undertaken to demonstrate culling methods.

It is true, however, that incidentally acquired poultry knowledge does not qualify these ambitious girls as poultry experts. Their college training has been largely along the lines of household science and home economics. When it comes to the practical side of poultry husbandry, they should understand that poultry keeping is not less specialized than dairying, that it is not unlike other live stock enterprises on the farm, and is a branch of animal husbandry. The fundamentals of feeding, housing and caring for poultry are similar to the fundamentals underlying the successful handling of other kinds of live stock, and it is the county agent who is qualified by training and experience to undertake poultry extension work.

We would not be understood as minimizing the importance of women's work with poultry on the farm. There is no valid reason why the farm woman should not assume a sense of responsibility in connection with the farm flock, and enjoy the reward that these creatures of nature make in response to good care and attention. However, let the advice to her on poultry matters be in the form of Government or State bulletins rather than inexpert personal opinion. The permanency of home demonstration work cannot be based on a smattering of poultry knowledge.

Rhode Island Whites

Whether or not the Rhode Island White is a distinct breed, having enough breed character to distinguish it from other breeds and justify its admission to the Standard, is a question that will have to be met and answered. The variety is coming forward, making new friends, proving its worth as a utility fowl, and increasing in numbers in the show rooms. The latest demonstration of strength is the publication by the Rhode Island White Club of America of a hundred page year book for 1921, in which 348 members are listed.

There could be no logical objection to recognizing a white variety of the Rhode Island Red breed, if that were the only question. Multiplication has followed in every popular breed. The Plymouth Rocks were introduced as a barred variety, to be followed by whites and buffs. The Wyandotte was originally a silver laced variety, to be followed by gold laced, whites, blacks, buffs, etc. But, in the matter of adding a white variety of the Rhode Island Red breed, you are met by competition in the field and the claim that the field is covered.

The difficulty attached to the effort to secure Standard recognition for the Rhode Island White lies in the fact that the Single Comb variety has no breed characteristic that will distinguish it from the White Plymouth Rock. Both varieties have long bodies, yellow shanks and single combs. No distinguishing breed characteristics are possessed by the S. C. Rhode Island White to set it apart from the White Rock and prevent the two from coming into close and acrimonious competition.

First prize and shape special R. C. Rhode Island White hen at St. Paul, 1919. This is typical Rhode Island Red shape.

Photos by courtesy of W. J. Stephan, Minn.

The case of the Rose Comb Rhode Island White is quite different. While it has a rose comb, yellow shanks and white plumage, which are breed characteristics of the White Wyandotte, the type of the R. C. Rhode Island White is quite distinct from the ideal type of the White Wyandotte. As an example of what distinctive type is being produced in the R. C. Rhode Island Whites, we present herewith an illustration of the first and shape special cockerel at the Minnesota state meet of the Rhode Island White Club, December, 1920; also the first and shape special Rhode Island White hen at the St. Paul show, January, 1919. The cockerel scored 94½ and was the highest scoring solid-colored bird in the show.

First prize and shape special R. C. Rhode Island White cockerel at Minnesota State Show, December, 1920.

Such true shape as possessed by this pair of Rhode Island Whites would become many Rhode Island Reds. The birds not only have long top lines, but correct under lines. This oblong conformation is plainly different from White Wyandotte type.

The question of extending recognition to the Rhode Island Whites will come up at the next meeting of the American Poultry Association. Favorable action can be taken on the Rose Comb variety without detriment or injury to any variety now accorded a place in the Standard.

The pendulum of every new breed has been swung in motion by enthusiastic young breeders. Such are the loyal boosters of the Rhode Island White.

Fake Stocks and Good Securities.

It is astonishing that millions of dollars should be invested every year in fake stocks. The high rate of interest promised and the gold seal may look good, but when the holder of purely speculative stocks needs money and goes to sell his stock certificates he finds that no man with money has confidence in them. American Poultry Journal has always sought to protect its readers by never accepting advertisements of stock-selling schemes.

The selling of War Savings Stamps, Treasury Savings Certificates and Liberty Bonds during the war and since, has done much to apprise the public of what good investment securities really are. The interest on these securities is sure, and every dollar of the principal will be paid. Sound investments of this kind breed thrift. Gold bricks and get-rich-quick stocks dissipate the savings of a family.

A new form of Government approved security is now being offered to the public. The Supreme Court of the United States has approved the Federal Farm Loan Act, and the twelve Federal Land Banks of the United States, each with a paid-in capital of \$750,000, are now doing business.

These land banks lend money to farmers. Ordinary banks receive money in the form of deposits and then lend that money to borrowers. The land banks secure money by selling bonds which pay 5 percent. The money thus secured is loaned to farmers on farm mortgages at 6 percent. That gives the bank a margin of 1 percent to operate on.

But, the plan goes further than this.

FIRST BOOKINGS

COCKERELS

From the Strain That Produced the WORLD'S CHAMPION

Alderwood Manor
"BABE RUTH"
Trapnest Record 326 Eggs
in 1 Year

5,000 Pullets
Trapnested Yearly
Incubator Capacity
55,000 Eggs

Your first opportunity to purchase breeding males from the famous Alderwood Manor Strain of White Leghorns—the strain that produced Alderwood Manor "Babe Ruth", the hen that laid 326 eggs in one year.

Bookings now being received for cockerels from hens with guaranteed trapnested records of 240 to 279 eggs, March and April hatch, delively at 10 weeks. Attractive prices to breeders who order 12 or more birds now. (These birds would cost \$15 to \$25 at maturity.)

We will also book orders for limited number of mature cockerels for September delivery from hens with records of 280 to 326 eggs.

These records are absolutely authentic and guaranteed by Puget Mill Company—established since 1853—founders of Alderwood Manor.

How Mrs. Lane Solved her Problem

SHE had heard a poultry expert say, "any straight grain mixture or grain product such as meal or stale bread, *lacks* elements for making bones, muscles and nerves." But how to always get the right ingredients and properly balance them—that was Mrs. Lane's hard problem.

Purina Chows Increased her Profits

A Purina Dealer's sign attracted Mrs. Lane to the "double-development" system of feeding. A trial of *Guaranteed Purina Chows* showed her how much real money she had been losing all these years. Now Mrs. Lane gets "fryers" in about half the former time. She makes pullets lay the first winter. She gets *more eggs* the year 'round.

See your Purina Dealer today, or write us. Ask about the Purina iron-bound guarantee. You get double the development you obtain from grains, or you get your money back. Ask for the Purina Book, packed full of usable poultry information—FREE. State the number of chickens you have.

CARBOLA

The Disinfecting White Paint

THE COMMON
CHICKEN LOUSE
ENLARGED

It breathes through pores in its sides, and in breathing cannot avoid inhaling the finely powdered Carbola, which kills it.

The Cheapest Louse Powder

Lice and mites come with the warm weather—in swarms. They are found in every locality where poultry are raised and if not controlled retard the growth of the young birds and reduce the vitality of the grown hens. They make your flocks susceptible to diarrhoea and other diseases, and you find fewer eggs in the nests than you ought to.

Thousands of poultrymen who mix Carbola with water and apply it as a paint and disinfectant to the walls, roosts, nest boxes, ceilings and floors of their poultry houses, and work it into the cracks and crevices as a help in controlling the mites, also use the dry Carbola powder as a louse powder for dusting their birds and are thoroughly satisfied with the results it gives.

Carbola is harmless to the smallest chick and it can be applied freely without fear. Dust the bird with the dry Carbola powder, rubbing it into the feathers with your fingers. In some cases it may be necessary to repeat the operation in ten days. Sprinkle it in the cracks and crevices everywhere with an ordinary blower. Work it into the dust bath. Give it a trial not only on your poultry, but on your cows, hogs and other farm animals. It costs only one-third as much as other louse powders.

Carbola mixed with water makes a smooth-flowing disinfecting paint for use instead of whitewash. It doesn't peel, flake or scale off. It can be applied with a brush or spray pump to wood, brick, stone, cement or over whitewash.

Your hardware, seed, paint or drug dealer has Carbola or can get it. If not, order direct
10 lbs. (10 gals.) \$1.25 and postage 20 lbs. (20 gals.) \$2.50 delivered 50 lbs. (50 gals.) \$5.00 delivered

CARBOLA CHEMICAL CO., Inc., Dept. I 299 Ely Ave., Long Island City, New York

The Government wants to help the farmer kill off his farm mortgage. So the Land Bank charges 7 percent and the extra 1 percent enables the farmer to kill off his mortgage in 33 years.

This is the way it works: A farmer goes to the Land Bank and gets \$3,000. In order to get this money, he, of course, has to furnish evidence of his title, and his land must be appraised. He takes the money on 33 years' time. This does not mean that the loan runs for 33 years and then falls due. The loan is "amortized" or killed off in the following way:

The farmer pays 6 percent interest on \$3,000, or \$180 a year. He amortizes the loan by paying another 1 percent interest, or \$30 to the \$180 interest, making \$210. By paying this sum of \$210 annually for 33 years, he not only keeps the interest paid on the debt but pays off and extinguishes the debt itself.

By the old system of usury lots of men have paid 6 percent interest for years and years, and the debt was as big at the end of that time as it was in the beginning when the mortgage was made.

The Land Banks will not make loans to exceed 50 percent of the value of the land mortgaged. Only 20 percent of the buildings and permanent improvements thereon are accepted as security. This emphasizes that the earning power of the land itself is the principal factor in making an appraisal. As a general policy, therefore, the Federal Farm Loan Board has encouraged the making of loans for the promotion and encouragement of general farming rather than for any specialized branch such as poultry culture, dairying, etc., where the land is often limited and the investment in buildings and equipment relatively great. The Acting Secretary of the Farm Loan Board writes: "It is the land after all which remains the permanent basis for a loan, and all our appraisals are made on this basis irrespective of the crop or kind of live stock raised."

THEORETICAL STANDARDS.

The question of revising the Standard of Perfection, which is the established guide for judging fowls, is bringing out a great deal of discussion. A few letters on this subject are printed in these columns this month and a number of others are unavoidably held over for the July issue.

Production values alone are not an adequate basis for judging specimens of a breed, when the question of breed permanency and breed progress are paramount.

The cattlemen know something of judging for meat values rather than breed type and breed quality. Their fat steer classes provide an unsolved problem for them. Just recently Col. F. M. Wood, famous as an auctioneer of purebred cattle, has become a silly theorist in suggesting a new way to judge beef cattle.

Having paid \$2.50 a pound for a rib roast from a fat Hereford steer that was shown at the last International Live Stock Show, he suggests applying surgery to the show room, and recommends that in judging fat steers, "an incision be made in each animal, where the fat is the thickest, so as to ascertain the edibility and quantity of lean meat."

By making this examination, he says,

overly fat steers will not be the sole winners, and prizes will be placed on "intrinsic food value." The Breeders Gazette points out the absurdity of plugging a fat steer like you would a watermelon to see what relation the green rhine has to the red fruit. The Gazette says:

If "intrinsic food value" is all there is to beef production, our fat steer classes at the International should be abandoned, and skinny canning cattle substituted. A canner, if converted into chopped meats, would score high on a nutritive basis, but the Colonel might not relish that kind of beef. Some of the fat bullocks exhibited are overdone, and, in a dressing contest, would make a poor showing; but one of the objects in fitting and exhibiting them is to demonstrate beef type in that sumptuousness of covering which accents type, and indicates the kind of response which cattle of improved breeding make to feed. Most judges know when a steer is "excessively fat," as the majority of their decisions prove.

It may be some consolation to know that there are theorists in all branches of live stock, even though it seems that the American Poultry Association has more than its share of them.

Death of E. E. Richards.

E. E. Richards, publisher of Western Poultry Journal, formerly president of the American Poultry Association, also ex-president of the Chicago Coliseum Poultry Show, passed away at his home

The Late E. E. Richards.

in Cedar Rapids, Iowa, on April 28, 1921.

Mr. Richards had not been in good health for several years, and suffered a stroke of paralysis a year ago which affected his right side and made it impossible for him to attend the last A. P. A. meeting or meet his friends at the shows last winter. On April 26 he suffered a second stroke quite unexpectedly, and died two days later.

Dick Richards will be missed not only in Cedar Rapids of which city he had been a life-long resident, but also in that national circle of poultrymen in which he occupied a prominent position for many years.

Mr. Richards was a public spirited man, interested in the enterprise and welfare of his city, his state poultry

Down-to-Date Prices for Dependable Single Comb White Leghorn Chicks

We have cut the price of our chicks owing to the decreased cost of production at this time of the year. Our hatches are now giving us a lot more chicks from the same number of eggs and we are passing along the benefit to our customers. You now have the chance to buy dependable chicks at the cost of the Common Hatchery Product. Every egg in our incubators is produced on our own Farm, all Grade A. stock for the rest of the season. We have been shipping over 20,000 chicks a week for months to satisfied customers. During June and July we are guaranteeing 100% alive and strong chicks, parcel post prepaid.

25-499 chicks.....20c each
500-999 chicks.....19c each
1000 or more chicks.....18c each

Our June Chicks will show you as good yearly profits as earlier chicks and many times prove the most profitable of the year. Get late Leghorn Chicks for steady winter egg yield.

8 to 10 Weeks Old Pullets

We have 15,000 now on the range ready for shipment this month and next. We have had good luck with them and we believe them to be the healthiest and most vigorous large flock of young pullets in the east today. They are all on new land and in new buildings and are being raised on unlimited range.

These pullets were hatched from our choicest breeding pens we have this year and are the cream of our best egg-bred blood.

Every shipment is guaranteed to be 100% satisfactory at the time of sale. Write and tell us how many pullets you want and the date of delivery you wish and we will quote you prices you can afford to pay.

District No. 7—

Walter Burton, Arlington, Tex..... 108
W. G. McCormick, Prairie Grove, Ark. 21

The interest of the breeders ran deep, as evidenced by a total vote of 2,230 for the office of president against a total of 1,442 votes cast for president last year.

Members who had not voted in years saw in the candidacy of Thos. F. Rigg an opportunity to put at the head of the American Poultry Association a man of the old school of gentlemen-fanciers.

Mr. Wolsieffer stood on a platform that called for an organization of commercial interests as well as an organization of breeders. The new Constitution of the Association is drawn upon this basis of 50-50; and it is a notorious fact that it is not operating, for the association is unable to function in that way.

Mr. Rigg's platform stated: "I believe that the association should be redeemed for the breeders of purebred fowls." This was the issue and he fought it out on this line. The silent strength of the purebred breeders swept him into office with a majority of 836 votes, which is more than the entire vote cast for his opponent.

H. A. Nourse is elected vice-president by a small lead over Ed. L. Hayes. Mr. Hayes is at present vice-president of the A. P. A., and was heavily handicapped by being a part of the present inert administration. Thus encumbered,

A New Idea in Mammoth Incubators

“Add A Section” As You Need It

Here is the latest thing in incubators—a sectional machine that exactly fits the requirements of each individual poultryman. You can start with one or two units of 250-egg capacity and as your needs grow, you can add additional sections until you have a machine of 2,000-egg capacity. One Sol-Hot Heater will heat one or eight sections.

During the past few years there has been a constantly growing demand for a larger incubator—something in between the usual standard sizes and the large, expensive Mammoth Incubators. This induced me to study out, design and perfect an incubator that would best fit this need. Here it is, the

MUL-TI-DEK SECTIONAL MAMMOTH INCUBATOR

If you are planning hatches from 250 eggs up to 2,000 or more, you will find the MUL-TI-DEK just what you want. You don't have to spend a big amount of money for a mammoth machine—you can start in a small way and add a section at a time just as you need it. Each section can be operated independently of the others if desired. This New Idea in Incubators will exactly meet the requirements of the poultryman who would like to start in a small way with a moderate investment and let his profits pay the way of his expanding business. The MUL-TI-DEK, scientifically designed to insure best results and being heated with my famous Sol-Hot Heater, you are assured of a practical successful Mammoth Machine second to none on the market.

Write For Free Mul-ti-dek Catalog Folder

Space will not permit a detailed description of this ideal Mammoth Machine. Write for free illustrated catalog folder, which tells all about it—how it is built—how it is operated. We will also send you complete plans so that you can build it yourself and save a lot of money.

Important Notice to Dealers and Agents of Poultry Supplies

Within a few weeks I will be ready to announce to the poultry raising public some startling improvements on the Sol-Hot Heater, for Brooder and Incubators that will be a revelation. *Watch for future announcements.* These *NEW* improvements will be a big factor in the success of your business next year.

YORKVILLE, ILL.

his friends should be more than pleased with the splendid vote he polled.

Mr. Hayes had been vice-president only about six months when the ballots for the 1921 nominations were mailed. He was inaugurated at the last convention and will not serve until the forthcoming convention. Following this procedure Mr. Rigg will not be inaugurated until well on toward the close of the Seattle meeting; in other words, unless the order of business is changed, he will not assume active administrative duty until the closing hours of the convention. Therefore, let us look well to the future and not hold the incoming president responsible until the days of his responsibility arrive.

CURRENT NOTES AND COMMENT

World's Poultry Congress.

A World's Poultry Congress will be held at The Hague, Holland, Sept. 6 to 13, 1921. The secretary of the congress, C. S. Theo. Van Gink, of Holland, writes:

"Many thanks for copy of your December Journal. I read your editorial reference to the World's Poultry Conference with great interest. Things are not so upset in the Old World as many Americans are led to believe. I can very well understand that all the troubles of Europe, gathered and fitted out with big headlines has made every American doubtful as to our future, and it will certainly take half a dozen years to make the world over here look better, but the national enterprise in Northwestern, Western and Southern Europe, as well as in Germany, is fast growing; and among the industries which are doing exceedingly well over here, poultrykeeping may be counted.

"Every country wants to get more and better stock and American breeders would certainly find a market over here for high-class breeding stock; and would no doubt be able to enter birds at the World's Poultry Exhibition and sell them at such prices as to pay well for their expenses. Their exhibits would certainly create a demand for their stock, as in several countries of the continent the American Standard is more closely followed than the average American poultry breeder is aware.

"Thirteen or fourteen national committees have already reserved space at the World's Poultry Exhibition and are sending birds. Outside of Europe I may mention Canada, Rhodesia, British India. New Zealand may also be represented."

Prof. Jas. E. Rice, Cornell University of Ithaca, New York, is chairman of the American committee on arrangements, and can supply detailed information on the World's Poultry Congress.

* * *

Cornish Type.

There has been considerable comment on the Cornish that are winning in the shows today. It is said that they have too much of the short-legged Aseel type. This very blocky build is characteristic of the best English birds, and it is from England that this type is being imported. It is interesting to note that William Brent, the greatest breeder of Cornish in England, whose fidelity to the breed has extended over a period of forty years, has recently remarked:

"I fear there is a tendency to breed Cornish too much like Rouen ducks, or Dorkings, instead of birds with the 'coat-of-mail' appearance, with predominant vigor and constitution."

* * *

The Tariff.

Eggs and poultry were not included in the Emergency Tariff Bill. The principal drive has been to get these items included in the General Tariff Bill which will follow. Prof. Jas. E. Rice of Cornell University has been particularly active in behalf of the producers, and with the help of the Pacific Coast interests, has been instrumental in developing strong support in Washington for a high tariff on eggs and egg pulp.

Not As Bad As It Seemed.

The flow of farm eggs has been heavy this spring. Grain on the farms was cheap. The farmers fed their hens abundantly, and produced a bountiful supply of spring eggs which had an immediate cash value in a high market. Weather was favorable for egg production. What happened is what seasoned men in the egg trade say happens about once every twenty years.

But, the sky is clearing. The egg flow gives signs of letting up. Receipts at New York, Boston, Philadelphia, and Chicago for the week ending May 14, were 11,500 cases less than for the corresponding week of 1920. On Monday, May 16, the receipts at the big four markets were 94,000 cases, which compare with 118,000 for the corresponding day of 1920. A slump in receipts does more than any other one thing to strengthen prices, and take the market out of the domination of the buyer and turn it to the advantage of the seller.

* * *

On Advertising Poultry Products.

Prof. F. E. Mussel of Nebraska Agricultural College has submitted figures to show that the domestic consumption of eggs is not as heavy as last year. A similar condition is found in meat consumption, butchers not selling as much meat as a year ago.

Publicity work to increase consumption of eggs has been suggested. Eggs contain vitamins necessary to health and growth, similar to the vitamins contained in milk. Meat is deficient in these. The food value of eggs should be advertised, but the first thing to do is to get eggs standardized so that the purchaser will get full 24 ounces in every dozen. Uniformity is necessary in an advertised product.

* * *

Co-operating Producers.

Petaluma producers are putting their eggs in storage. It costs them 7 cents to transport a dozen eggs to New York, so they cannot compete in the present market. They will bring out their eggs this fall and winter when the packers do. That will mean profit instead of loss.

Movements are on foot in New Jersey and in the vicinity of Kansas City, to develop co-operative egg-marketing associations for producers, similar to those on the Coast.

Producers are giving more thought to the marketing questions. Ralph Mason, state extension poultryman in West Virginia advises that Wood and Pleasant counties, West Virginia, have organized poultry branches of their farm bureaus to co-operatively buy poultry supplies and sell poultry products.

* * *

Fine Feathers Not a Delusion.

Fine feathers indicate quality. They indicate careful breeding, proper feeding and good care generally.

* * *

A trip to Seattle, Aug. 8 to 13, means a trip across the continent, and "more real geography than you ever knew in your life." So say the promoters. Few breeders from the central and eastern states, however, can attend.

* * *

New Jersey State Legislature has appropriated \$85,000 for a new poultry building at the New Jersey State College of Agriculture.

* * *

J. W. Parks' famous Barred Rock hen, Miss Smarty, was hatched July 3, commenced laying Jan. 9, and by the next Jan. 1, had 325 eggs to her credit.

* * *

Chas. G. Pape, D. M. Green and Ed. L. Hayes have been mentioned for business manager of the A. P. A.

* * *

It has been suggested that poultrymen erect a monument to Walter Hogan in his old home town in Minnesota.

* * *

Ed. L. Hayes says that the victory has only been delayed and that he will be a candidate for vice-president of A. P. A. next year. A live wire like Ed. helps to keep up interest in the organization.

* * *

Gus Arnold says: "Well, boys, you are doing fine and I predict that within a very few years the beautiful Buff Leghorn will be a great leader."

Feed for Quick Growth

Every poultry raiser should learn how to feed for quick growth and how to save feed. Even at present low grain prices, feed should not be wasted. Learn how to develop your chicks quick for early laying—how to feed at the correct periods of the day, in the right manner and in proper proportions. Don't lose money experimenting. Take advantage of what others have proved by years of costly effort. Nearly 30,000 have found "Dollars and Sense in the Poultry Business" a real guide to bigger profits and success. Written by T. E. Quisenberry, Dean of the American Poultry School and one of America's foremost Poultry authorities. This 96-page book will be sent free to any reader of this paper. Simply address, T. E. Quisenberry, Pres., Dept. 2067, Kansas City, Mo.

BUCKEYE

The Real Business

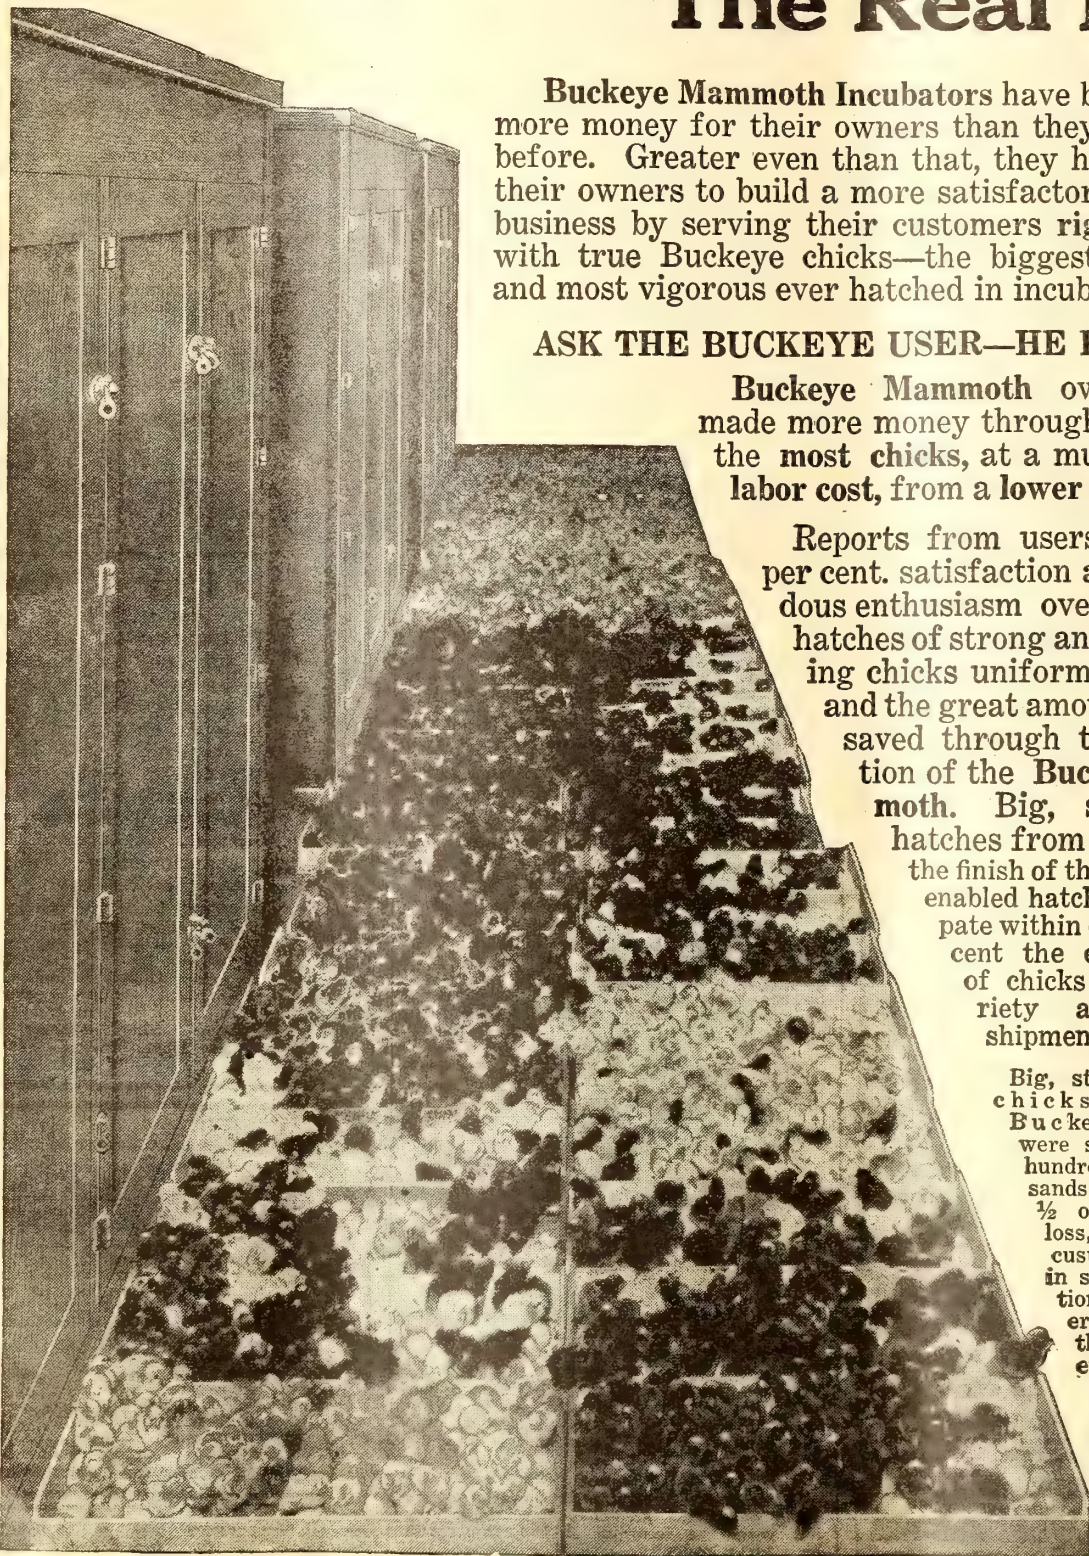

Buckeye Mammoth Incubators have been making more money for their owners than they ever made before. Greater even than that, they have enabled their owners to build a more satisfactory and loyal business by serving their customers **right on time** with true Buckeye chicks—the biggest, strongest and most vigorous ever hatched in incubators.

ASK THE BUCKEYE USER—HE KNOWS!

Buckeye Mammoth owners have made more money through producing the **most chicks**, at a much **reduced labor cost**, from a **lower investment**.

Reports from users show 100 per cent. satisfaction and tremendous enthusiasm over the large hatches of strong and quick selling chicks uniformly obtained and the great amount of labor saved through the installation of the **Buckeye Mammoth**. Big, satisfactory hatches from the start to the finish of the season have enabled hatchers to anticipate within one to five per cent the exact number of chicks of each variety available for shipment each week.

Big, strong, vigorous chicks hatched by Buckeye Mammoths were shipped by the hundreds of thousands with less than $\frac{1}{2}$ of 1 per cent. loss, arriving in the customers' hands in such fine condition that the buyers became enthusiastic boosters, who recommended the purchase of "Buckeye" baby chicks to their friends and neighbors.

MAMMOTH

Better Service

ness Incubator

Mr. Grant Curtis, editor of the Reliable Poultry Journal and former president of The Cyphers Incubator Company, declares the method of incubation used in the Buckeye Mammoth Incubator the greatest invention of the kind since the dawn of the Christian Era.

Many a user, pleased beyond expression by its actual performance, will echo Mr. Curtis' strong praise. These users know that with Buckeye Mammoths they save half the labor, require one-fourth the room, save much on the cost of operation, expend much less for installation and get more and better chicks.

These results demonstrate beyond question the value of the new principles applied to incubation exclusively in Buckeye Mammoths.

Revitalized air of proper warmth is forced over the hatching eggs in abundance by specially designed, ball-bearing fans, operating constantly. Automatic heat and moisture control provide ideal conditions for hatching.

NO COOLING REQUIRED

No cooling is required in these incubators, and the eggs can be turned by the simple shifting of a rack, thus effecting a great saving of time and labor.

Additional trays for hatching enable a third of the eggs to be hatched on the same day each week. Heating is by a double Perfection Oil Stove or Gas Burner operating the famous Buckeye Hot Water System. Two gallons of oil or 250 feet of gas is the outside consumption per day for the 10,368-egg size.

No special building is required for these incubators. Their operation is easily understood, and is thoroughly taught by the factory expert who sets up the incubators.

USERS BUY AGAIN

Last season we were compelled to disappoint many whose orders came in too late. This year we shall build a much larger number, but the hatcheries now using this equipment have already ordered a large number of these machines, so that the number available for those who desire to place commercial hatching on a more profitable basis will be limited.

Write to us for the Mammoth Catalog at once and get in your order at the earliest possible day. Only in that way can you be sure of delivery.

10,368
eggs

Buckeye Mammoth Incubators Made in Three Sizes: 10,368 egg, 4600 egg, 2440 egg.

BUCKEYE MAMMOTH INCUBATOR No. 7

Capacity—10,368 eggs held in 108 turning trays. This capacity does not include the 36 hatching trays.

Size—Eight feet, six inches square; height, seven feet, three inches.

Weight—6,800 pounds, crated.

Case—Selected California redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1½ inch cast iron pipe.

Egg Trays—108 turning trays with a capacity of 96 eggs each, and 36 additional hatching trays. All trays equipped with convenient card holders, which make record keeping easy.

Electric Fans—Four ball-bearing fans, specially constructed.

Thermostat—Five-inch, double disc thermostat, of the wafer type, which is specially constructed to provide the highest efficiency in temperature control. Solid brass hardware used on Buckeye Incubators.

BUCKEYE MAMMOTH INCUBATOR No. 8

Capacity—4,600 eggs.

Size—Five by eight feet; height, five and a half feet.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1½ inch cast iron pipe.

Egg Trays—48 turning trays with a capacity of 96 eggs each, and 16 additional hatching trays. All trays equipped with convenient card holders, which make record keeping easy.

Electric Fans—Two ball-bearing fans, specially constructed.

Thermostat—Same as No. 7.

BUCKEYE MAMMOTH INCUBATOR No. 6

Capacity—2,440 eggs.

Size—Five feet square, 32 inches deep. Legs eighteen inches high.

Weight—850 pounds, crated.

Construction—Case, selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1-inch cast iron pipe.

Egg Trays—Twenty egg trays, with a capacity of 122 eggs each.

Electric Fans—Two 9-inch ball-bearing fans, specially constructed.

Thermostats—Same as No. 7.

Complete Assembled—Each machine is tested at the factory and completely assembled, with the exception of a few small parts which any person without experience can assemble without difficulty.

SILVER WYANDOTTES.

(Continued from page 646)

utmost if brought forward in this country.

"I have no doubt that laced saddle cocks can be bred, as I have many of them myself and have found them to be the best pullet breeders, beautiful birds of their kind; but when compared with a good show cockerel they are not in it, as they do not have that beautiful clear silvery appearance that you get in a good striped saddle.

"Our Standard is very similar to the American Standard of Perfection, and I think it was taken from the American Standard when first drawn up, but revised in some points, namely, one sentence in the old Standard reads 'fluff slate color, thickly powdered with white.' When you get this the birds are full of frosty or white fringe on edge of feathers. We changed this to dark slate or black, showing as much lacing as possible.

"Our Standard is changed by members of the Wyandotte Club and not dictated to by any other club. How can any other club draw up a Standard to be a success without the advice and sanction of the best breeders of the variety? I am breeding the pullet line largely, so would not be a loser by the change of Standard, as I already breed laced males; but I am a great admirer of good show cockerels as they now are, and shall be very sorry to see any change in the Standard, and strongly advise Silver Wyandotte breeders to leave well enough alone."

Sound advice from a master breeder of Silver Wyandottes that should be heeded by all intelligent breeders who have the best interests of their favorite variety at heart.

The illustrations accompanying this article are reproduced from photographs of a hen-feathered or pullet-breeding male from a successful breeder in Australia.

Birds in Hands of American Breeders.

It may be also interesting to state that a pure English pullet breeding pen of Silver Wyandottes is being bred by Dr. Charmbury in Pennsylvania. They were imported direct from Mr. Philipson over a year ago. An inspection of the pen made recently showed five hens of good type and size, finely laced in all sections, the white centers being clean and free from smut or peppering. The five feathers illustrated on page 647 were plucked from the wing-bows of the five different birds to demonstrate the uniformity in the markings. The cockerel mated to these birds is a rugged looking male with large open centered, well laced feathers on breast and body and finely triple laced wing-bars; top color running fairly even but somewhat brassy and deficient in striping of hackle and saddle, with laced feathers or tail coverts.

The exhibition cock, "Ideal 6th," illustrated on page 646, is a son of "Ideal 5th," a pure lineal descendant from the Ideal male line originated and bred by John C. Jodrey. The characteristic head points, silvery top color, breast lacing and well defined wing-bars, as well as good type of this strain, are preserved in the Madison Square Garden winner at the club show, 1915-16. It is a male bird of this character that should be mated to hens which as pullets were clean in the white centers but rather strongly or more heavily laced than the modern exhibition female. Such birds in their second year will show up dark or mossy on the back and over wings, but are sound in color of tail and flights. The neck must be silvery white, each feather well striped with black. Special attention should be paid to their wing-bars, the feathers to have good sized oval

The Early Illustration of Silver Wyandottes Made for
L. H. Whittaker of Michigan in 1874.

centers with intense, well defined black lacing. From such a pen a large percentage of the cockerels should prove to be high class exhibition specimens.

In the Show Rooms.

The great trouble in the past has been the diversity of type, lacing and color of Silver Wyandottes. The accepted ideal pattern for lacing today is that of the Sebright, but an oval centered feather. The rather long and pointed feather with the narrow Sebright lacing is usually a brownish black lacing, and the oval shaped feather is desired, with lustrous black lacing of a width proportionate to the size of the Wyandotte,

where there is good quality from which to choose, the safest rule to follow is to select for Silver Wyandotte character first, regardless of the lacing or lack of it. The specimens can be rated by giving them a one, two or three X mark according to their type or shape. From those rating highest in the latter respect, the best laced birds can be picked for the winners. Uniformity of type and color can only be established by judges adhering strictly to the Standard, and when exhibitors once begin to realize this, they will pay more heed to shape, lacing and color and less to individual color sections.

which is a much larger bird than the Sebright bantam. This should apply to all males as well as to females, as extreme narrow lacing on males is most likely to produce light under-color and loss of black in hackle, saddle and flights.

Judging Silver Wyandottes has been no easy task, simply because the judges have been confronted with too many extreme types in color and shape in the past. They run across a bird with fine Sebright lacing but with a body like a camel, or find one of good type with the old V-shaped type of centers, each exhibitor no doubt deeming his entry a star.

To pass by a beautifully laced bird of the Sebright type for lack of shape, and to award the prize to one of the obsolete dark colored specimens because it is grand in shape, demands not only courage but nerve as well. In a good class, where there is good quality from which to choose, the safest rule to follow is to select for Silver Wyandotte character first, regardless of the lacing or lack of it. The specimens can be rated by giving them a one, two or three X mark according to their type or shape. From those rating highest in the latter respect, the best laced birds can be picked for the winners. Uniformity of type and color can only be established by judges adhering strictly to the Standard, and when exhibitors once begin to realize this, they will pay more heed to shape, lacing and color and less to individual color sections.

Farmers Should Buy Federal Farm Loan Bonds

FEDERAL Farm Loan Bonds are *safe*. They are secured by first mortgages on productive farms, the kind of assets with which you are already familiar, and in addition they are guaranteed jointly by the 12 Federal Land Banks with a combined capital of over \$24,000,000.

Federal Farm Loan Bonds pay 5% interest—a better net income than from most farms rented to tenants.

Federal Farm Loan Bonds are *tax-free*. The principal is exempt; likewise the income from it.

Federal Farm Loan Bonds are *staple*. They bring a steady, dependable income twice a year, good seasons and bad, are A-1 security for loans, and are easily and quickly convertible into cash.

Farmers who buy Federal Farm Loan Bonds help to build a farmers' national co-operative banking system. These bonds can be had in denominations of \$100, \$500, \$1000 and \$5000, either coupon or registered form.

Keep your money out of "blue sky" schemes. Put it where it will be safe and help to build up the whole farming business. Buy Federal Farm Loan Bonds and encourage your neighbors and farm help to buy them.

**You can buy Federal Farm Loan Bonds from
any Federal Land Bank**

FARM POULTRY FLOCKS A SOURCE OF PROFIT.

(Continued from page 641)

bankers recently stated that a majority of their deposits were coming from egg checks.

Better Methods of Handling Adopted.

The changes in farm poultry keeping operations during the past five years have been truly revolutionary. Greater interest in record keeping has pointed out the importance of the farm hen, and the widespread introduction of culling methods has created a hitherto unknown interest and enthusiasm for well bred poultry and for up-to-date methods of handling the flock. Five years ago all hens looked alike to the average Missouri farmer so far as their laying capacity was concerned, but at the present time it is indeed rare to find a farmer who does not understand the principles of culling for egg production, or to visit a flock where some effort is not being made to feed and handle the hens in a way to make them lay more eggs.

Recent visits to a number of farm flocks in several different Missouri counties have shown the attitude that wide awake men on the farm are now taking toward their poultry. In Lincoln county the owner of one of the best farms, with several hundred acres of rich Mississippi River bottom land, has purchased his wife a new up-to-the-minute electric incubator to be run by their farm lighting plant and is helping her trap-nest 25 of their most promising Brown Leghorn pullets.

Another farmer in that county who built a 30x30 straw loft, gable roof poultry house last fall reports that the profit from his hens during the winter months have practically paid for the building, and he is planning to build another such house to accommodate the pullets he expects to raise this year.

A renter on a 300-acre Lafayette county farm, valued at nearly \$300 an acre, admits that his wife made more profit from a flock of 200 hens during the past year than he made from 125 acres of wheat. They have bought a 40-acre farm and are planning to go into the poultry business on an extensive scale.

A former Missouri county agent now farming a highly fertile farm in Lafayette county reports that his farm income returns show a net loss of \$1,500 during the past year while his flock of 300 Leghorns shows a net profit of nearly \$1,000. He has a poultry house twenty-five feet square built according to the most modern ideas, hatches his chicks in a modern incubator and broods them with stove brooders in an 8x10 portable colony house. He has a good flock of Standardbred White Leghorns, and is hatching his chicks from a pen of hens selected as the very best layers from his entire flock, mated to a male, secured from the University of Missouri, with a pedigree showing a long line of 200-egg ancestors back of him.

A Ray county farmer who is making the best of some old buildings remodeled into a comfortable poultry house reports that his 300 White Leghorn hens returned him a net profit of more than \$150 during the month of March.

11 Men After 1 Chicken!

**For every Queensbury S. C. White Leghorn sold last year
we refused orders for ten.**

If you want profits investigate our trapnested free range stock. Vigor plus high pedigree breeding insures results.

Pullets now being reserved for shipment at eight weeks to four months. Breeders from our own pens at half price. Pedigreed cocks at \$5.00 each. Three months toe punched cockerels \$25.00 per dozen.

QUEENSBURY FARMS
123 North Main Street TOMS RIVER, N. J.

Ten farms visited during the past week all had good sized flocks of standardbred hens and were doing a constructive job of breeding for better laying qualities. In each case the man was taking an active interest in the farm poultry flock and had provided his wife with a stove brooder for raising the early hatched chicks which were found in large numbers on each farm. Four of these places had thoroughly modern poultry houses, and all were feeding a ration scientifically compounded to make hens lay.

Poultry is no longer considered entirely woman's work, and the fact that men are giving it some attention is helping to secure the modern equipment and intelligent attention to breeding and feeding details which are necessary to insure the greatest success.

A Change of Heart.

The minister in the German community reports that during the past fall and winter while eggs were fifty to sixty cents a dozen that he observed some of his most prosperous farmers bringing the eggs to town, and in some cases doing most of the driving with one hand while the other hand held the egg basket to see that none should be broken.

An ex-president of the county farm bureau in Saline county, Missouri, was in my office recently enquiring about the practicability of a house for 1,000 laying hens. He stated that the poultry flock had shown a greater profit than any other enterprise on the farm, and he is planning to enlarge his poultry keeping activities.

A well known professor of farm management in a state university who runs a fine farm on the factory plan is seriously considering adding 1,000 hens as one department of his farm operations.

With long headed farmers who have made a success of livestock breeding and other farm operations seriously turning their attention to poultry keeping, the development which will take place in the industry within the next few years is hard to estimate. The present trend indicates that the main business of poultry breeding is going to be taken out of the hands of the faddist by practical business farmers who are going into the poultry business because they can see an opportunity for legitimate profits and who will bend all their efforts toward developing strains which will be more efficient producers. The farm poultry keeper is not likely to lose sight of the importance of beauty of symmetry and color as has sometimes been the case with the commercial poultryman, but he is certain to lay principal emphasis upon the points which tend to make fowls more useful. The farm poultry keepers are beginning to be interested in the pedigrees of their chickens, and some practical method of guaranteeing that a bird has the breeding claimed is quite certain to result from the interest which plain practical farmers are taking in the business.

The evolution of the farm hen has made remarkable progress during the past ten years but it seems logical to assume that the development during the next ten years will be even more remarkable.

You'll want your Newtown *early* next spring—it will pay you to write us *now*.

When you install a Newtown Giant Incubator you bid good-bye to hatching troubles and worries. That's not a guess — it's a *record*. Years ago the Newtown passed the experimental stage. Today it is *the incubator* that offers the greatest value for the investment — the machine that leads the field for *quality* of service and *length* of service.

This explains why the Newtown is the favorite incubator of the most successful poultrymen and chick producers — why it is universally known as "the incubator that hatches the most chicks, the best chicks, with least labor and at lowest cost."

If you want an incubator that, hatch after hatch, season after season, produces the biggest hatches of the strongest, sturdiest chicks — one that is automatic in operation and reduces labor to the minimum — that safeguards in every way the valuable eggs you place in it — that will pay you the largest dividends — *you will order the Newtown*. And we advise that you take the matter up with us soon. Early action on your part will be to your advantage in several different ways.

You'll *want* your machine *early*. So why not avoid all risk of rush and delay in the winter by ordering it now and having it delivered this fall? Set it up and be ready ahead of your actual need.

Another thing, our orders already indicate such a heavy demand for these machines that our enlarged manufacturing facilities are going to be taxed to supply everyone. You certainly ought to take early action so you'll be *sure* to get your Newtown, and avoid any chance of disappointment.

We hope to build more Newtowns this season than ever — but *more people want them* — and if you are among them, *send in your order now*. You *know* the acknowledged hatching-supremacy of the Newtown — and you *don't want any substitute*. Your success demands big hatches, hardy chicks, safe, sure operation — in other words the dependable, genuine Newtown Giant Incubator. Write us now about your requirements for Spring of 1922 — what capacity you'll need — and let us advise you promptly.

NEWTOWN GIANT INCUBATOR CORPORATION

Harrisonburg, Virginia

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

GRIT AND MINERAL MATTER. First Prize Article.

Grit is to the fowl what teeth are to the animal. It grinds the feed and prepares it for digestion. It is then very reasonable to think that fowls will get much more good out of the feed they eat if they have a good supply of grit to enable them to thoroughly masticate it. Just as we know

a person will keep in better health if he chews his food well, so economy is really practiced when we look well to the supply of grit for our fowls.

It is essential that this grit be of rough character; that it must have sharp, protruding edges. It is these rough particles working against each other and with the feed that grinds it into pulp.

How often this matter of grit is

neglected in the pen of yarded fowls! The yard will look as bare of anything in the shape of grit as the desert of a green growth. The hens will have a dejected sort of look and the owner will tell you that they are a little puny. But it is not his fault, for he has been feeding them about all they will eat. When asked about the subject of grit he may seem a little astonished at the query and remark that they just pick that up as they wish.

In most cases, fowls running at large will get enough grit to supply their daily wants.

Yet we have seen many sandy locations where it was absolutely essential that it be supplied to fowls on free range. At any rate it will do no harm to have some sharp grit about the roosting house, in small boxes nailed to the wall of the house where it cannot be scratched out in the dirt, and where it will be in a convenient place for the birds to get it.

Oyster shells ground or broken to a convenient size for the fowls make a splendid addition to the feed. The shells contain so much carbonate of lime that it is readily assimilated by the hens. It is an important property used in the formation of egg shells and will go a long way toward preventing the laying of soft shelled eggs.

Tenn. A. A. Howell.

SPROUTED OATS FOR CHICKS AND OLD STOCK. Second Prize Article.

Are your hens laying and your chicks growing as they should? If not

—“as near perfect
as any human invention can be!”

—that's the Wishbone—the Mammoth Incubator that Mr. Levy says “will eventually be adopted by every successful poultryman in the country.” The Wish-

bone hatches sturdy healthful chicks at less cost, with less labor, and in less time than any other Mammoth. It also has greater capacity in less space. And yet it costs less than old-fashioned ordinary mammoths.

Wishbone Mammoth Incubators

Eliminates all handling of eggs. Built in 2 and 3 decks. Capacity 2,400 to 50,000 eggs.

try sprouted oats.

Several seasons ago I was not getting results from my hens. Some one suggested sprouted oats. I began to feed them regularly and in ten days' time my egg yield had almost doubled. When spring came I stopped feeding the oats and immediately the egg yield began to drop off. Needless to say, I went back to feeding sprouted oats and now I never stop the year round.

When the hot days come, don't stop feeding the sprouts. Hens appreciate the greens all the more in hot weather and they will show for it when they get their new feathers in the fall. The molt will be quick and the hens will get down to business sooner and their new feathers will come out a richer, even shade. Perhaps you will get eggs in the summer without feeding sprouted grain, but your hens will not be in good condition for the molt.

Start feeding oats to the chicks when they are two weeks old. Feed just a few of the chopped tender sprouts at first. If you give them too much it is liable to loosen their bowels. If the sprouts are fed long it may cause crop binding. Of course, to the larger chicks and old hens you feed the grain, roots and all.

I keep Buff Minorcas and find that the chicks are of better color when fed sprouted oats.

The small breeder and fancier who has no range or large yard will appreciate this.

A good many people say. "I would feed sprouted oats, but a sprouter costs too much. Here is a way to make a sprouter for a quarter that will supply sprouts for twelve hens.

Get five boxes from the grocery in which a dozen cartons of butterine came in. These are of nice solid wood and will not warp. These boxes can be procured for five cents apiece. Take off the tops, leaving only the sides and bottom.

Take a large dish pan, that can be found around home, and lay two flat boards, 12 inches apart across the top. Now set your boxes on these boards.

Fill a half-gallon Mason jar full of oats, and let them soak for 24 hours. Spread the soaked oats out level in the bottom of the box and water two or three times a day. Place the boxes and pan in a warm place in the cellar.

When the sprouts are about three inches high, feed to the chickens. For the sprouts to attain this growth will take from ten days to two weeks, depending on the warmth of the room. If the sprouts are yellow, put them in a light place for a day to turn them green. About a square inch a day per fowl is a good amount to feed.

Try feeding sprouted grain for six weeks and note the difference in your chickens.—R. F. Henderson, Ohio.

Linebreeding.

Linebreeding is worse than useless if you have not in your stock the characteristics you wish to perpetuate. Inbreeding magnifies a defect, just as it also makes more imperative a valuable feature.

Intelligent outbreeding is just as important as judicious inbreeding. When you find a defect in your line, infuse the blood that will overcome that defect, then linebreed to perpetuate the strain.—L. Black.

UHL'S DAY-OLD CHICKS

The Pioneer Mammoth Chick Hatchery—Our 21st Season

The largest and oldest successful hatchery. We produce chicks from free range stock that are strong, vigorous and full of pep. Years of experience have taught us how to hatch chicks that are satisfactory to our customers. If you want the best, we have them, all pure bred and at the most reasonable prices. We have the most popular varieties.

When Chicks are 4 Weeks Old
FEED THEM

FUL-O-PEP Coarse Chick FEED

We take pleasure in announcing to our patrons this new addition to the popular line of FUL-O-PEP Feeds. This new feed should be fed as the grain part of the ration of chicks from four weeks to three months of age.

We proved by tests and experiments that we could make the already popular "FUL-O-PEP WAY" of raising chicks a still greater success for our many patrons by adding FUL-O-PEP Coarse Chick Feed.

A High Quality Grain Ration for Growing Chicks

That's just exactly what FUL-O-PEP Coarse Chick Feed is—it's just the right size and contains the correct proportions of each ingredient for chicks from four weeks to three months of age—or until they are old enough to consume FUL-O-PEP Scratch Grains.

The three reasons why we urge you to add FUL-O-PEP Coarse Chick Feed to your FUL-O-PEP way of feeding are:

First: It prevents feed waste after the chick weans itself from *fine* chick feed.

Second: It contains an abundance of Oatmeal and Wheat — just the things to balance with mash feeding.

Third: It is without a doubt the highest quality growing grain feed ever offered the poultry raiser.

Ask your dealer to show you a sample of FUL-O-PEP Coarse Chick Feed. If he hasn't any in stock, fill out and mail coupon to us. We will send you sample by return mail.

Age 5 Months and Laying

Raised The FUL-O-PEP Way

Full of pep because raised the FUL-O-PEP way by Miss Mary Fanning, Nashville, Tenn.

"Jack" and "Lady Bonita," prize winning FUL-O-PEP birds owned by Miss Mary Fanning, Nashville, Tenn.

Hatched March 6, 1920. Laid first egg July 28, 1920. Owned and raised the FUL-O-PEP way by Walton Sadler, Nashville, Tenn.

RAISING poultry the FUL-O-PEP way is becoming recognized the country over as the *one sure way* to poultry success. South—North—East and West, wherever poultry is being raised, Ful-O-Pep Feeds are establishing new records in economical production of poultry meat and eggs.

The six pullets shown above were bred and owned by W. P. Graves, 1302 Eastland Ave., Nashville, Tenn. These pullets were from a flock of 15 hatched Jan. 26th, 1920. Ful-O-Pep Growing Mash was kept before them all the time. On July 2, the pullet marked X began laying. All were laying July 10. From July 2 to July 21, nine pullets laid 87 eggs — week of July 11 to 18, laid 41 eggs. Mr. Graves writes as follows:—

"On February 1st, 1920, I began feeding your poultry feeds (exactly as directed in your most valuable poultry calendar) to a flock of 15 white Orpingtons, hens and pullets. Results were: 101 eggs in February, 257 in March. With several setting in April, they layed 165 eggs — 200 eggs in May and 199 in June. With your feed and your method of feeding and caring for poultry as set forth in your 1920 Calendar, 'Back Lot' poultry raising can be made profitable." P-15

The illustrations at left are of Ful-O-Pep birds raised by Miss Mary Fanning, and Walton Sadler also of Nashville, Tenn. Miss Fanning is president of the Tennessee Poultry Association and both she and Mr. Sadler have achieved wonderful success in raising poultry the Ful-O-Pep way.

Our free poultry calendar, the book that has been the means of putting thousands of poultry raisers on the road to poultry success, will be mailed free and postpaid on request—write for this book today.

HOME ADVISERS' PART IN HANDLING THE POUL- TRY SITUATION.

By PROF. W. H. SMITH.

Home advisers of Illinois are confronted with a real problem in the handling of the poultry situation. "No other problem is more annoying," states one home adviser. "Perhaps this is because my training has been along other lines and I do not feel qualified to handle problems in this field." Another adviser voiced her sentiment in this way: "Some plan should be outlined to take care of the demand for poultry work, but I do not feel that the home advisers have the time or the training to assume this responsibility." Still another asks, "What shall I do? Many of the home bureau members take care of the chickens and they are asking for help." It is evident from these expressions that some of the home advisers are meeting a situation that opens a field for service, but it is one which finds them without any definite plan for undertaking the work.

Considerable thought should be put upon any plan before it is adopted by home advisers, in order for them to fully understand the kind and extent of the work they are undertaking. Handling the work under a loosely made plan would lead to difficulties and would occupy too much of the adviser's time at the expense of the more important activities on which farm women need help. Any plan should take cognizance of the fact that farm women are taking relatively less part in poultry work than formerly. The handling of poultry is becoming more of a man's job, or at least men are taking more interest in poultry affairs.

Why are men increasing their interest in poultry affairs? Simply because they are beginning to realize the magnitude and appreciate the importance of the industry. The value of Illinois poultry on January 1, 1920, was listed at \$32,000,000. The value of the egg crop of 1920 amounted to \$40,000,000. If the eggs produced had been divided among the people of the state, each person would have received 120 eggs for his share. With winter eggs bringing 6 to 7 cents apiece, the farmer can see more in poultry than a means of providing his wife with pin money, even though it did not always go for "pins."

Viewing from another angle, let us say that women are taking less part in handling the poultry work on the farms than they did ten to fifteen years ago. To my mind, this is not a cause for special worry, as the women are probably beginning to realize their physical limitations and inability to do a man's work outside in addition to a woman's work in the house.

It has always been assumed that it was necessary for women to handle the chickens to get spending money to buy "little extras." In some cases this has been true, but it is more often true that the eggs are traded for groceries and the problem of pin money is left unsolved. The younger generation perhaps understands how this problem actually works.

The young women of today do not have the time to devote to handling chickens that their mothers had. Club meetings and community work of various kinds, some of which is sponsored

by home advisers, take more of their
time, and the handling of the chickens
is left to the husbands. This change of
activities and responsibility may not be
for the best in all cases, but nevertheless
the change is evident and should be
recognized.

I will never forget the attitude of my
mother to the care of her chickens. No
rain was too heavy for her to venture
out into to save her chickens, even
though she usually returned soaking wet.
Many a night, a noise in the chicken
house would cause her to get up, light
a lantern and go out to make sure the
chickens were safe. She did these things
not because she needed this means of
getting spending money; she did it be-
cause she loved those birds. It was not
uncommon for her to raise two to three
hundred chickens and some ducks and
turkeys each year. On the same farm
today her daughter-in-law sometimes
finds it necessary to buy eggs for the
family's use. The husband in this case
deserves the criticism, as he has not yet
seen the light and assumed his respon-
sibility in this important branch of live
stock farming.

It is my belief that home advisers
should first consult the farm advisers
(county agents) before beginning any
poultry work in a county. Most farm
advisers have the poultry work listed
among their projects. The farm advisers
should be in a position to render service
along poultry lines, and the home ad-
visers can do the greatest good in co-
operating with them.

If poultry culling demonstrations
should be held in a county, arrangements
can be made by the farm or home bu-
reau for someone to do the work. The
home adviser can assist in advertising
these demonstrations among her mem-
bers and urging them to attend. It is
not necessary or advisable for her to do
the culling work.

In some counties the home advisers
have handled the work satisfactorily by
securing local expert poultry breeders to
hold culling demonstrations, who cull
flocks for all who are interested. A
charge of 2 cents per head is made each
owner for this work.

There are other problems fully as im-
portant as that of culling on which the
home advisers should become informed.
The matter of housing, care, feeding
and sanitation should precede or at least
go hand in hand with the demonstrations
on culling. No matter how successful
a job of culling is done, unless the birds
are properly housed and fed, the owner
will be doomed to disappointment. The
home advisers may find it necessary to
go direct to the husband and make him
realize that the poultry house needs re-
pairing or rebuilding. He will listen, if
gone after sufficiently hard.

When opportunity affords, the home
adviser should become familiar with
some of the more important breeds, at
least to the extent of being able to dis-
cuss them intelligently. With this in-
formation, some suggestion could be
made along improvement lines which
would be rendering a real service. A
woman can be taught the proper blend-
ing of color in feathers on a hat, so
why not help her to appreciate correct
color combinations in a similar way by
advocating pure breeds and stocking her
yards with birds of the right type and
color? Work of this sort is sure to
live and show progress.

1887-DAY-OLD-1921

CHIX-:-DUX

JUNE and JULY

Experience has taught the average
Poultryman and Woman; the men
and women whose time is largely oc-
cupied with other duties; that June
and July weather is ideal for the suc-
cessful rearing of young chix.

They know that only the PRO-
FESSIONAL POULTRYMAN, whose
time, energy and capital are entirely
devoted to this industry, can afford
to run the risk involved in the at-
tempt to successfully raise chix
hatched before this time.

They also know that pullets raised
from chix hatched during these
months will start to lay in November
and early December, supplying the
table or market with eggs at a time
when they are highest, while surplus
cockerels will quickly develop into
delicious SOFT MEAT ROASTERS.

Anconas, Barred Rox, White Rox,
White Wyandottes, R. I. Reds, Black
Minorcas, White, Buff and Brown
Leghorns, Mammoth Pekin and White
or Colored Indian Runner Ducklings,
bred from Hogan tested stock with
heavy egg producing ability, hatching

DISEASES OF POULTRY

By D. V. Salmon. 252 pages; 72 illustrations. Every poultryman needs this book. The cause, symptoms, care and remedies for each disease fowls are subject to are given. Price 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

The home advisers of Illinois and other states are rendering excellent service to the farm women of the state along the lines of food nutrition, home nursing, garment making, home management, school lunches, and social activities in the county. Progress along these lines will continue in proportion to the time the advisers have available for this work. There are other problems that need attention, but every home adviser should seriously question whether they should take the place of these fundamental activities for which the home bureau was founded.

ON THE TRAIL OF THE 300-EGG HEN.

(Continued from page 642)

us lose sight of the fundamental fact that proper breeding combines in well-rounded measure all of the desirable qualities needed, and is not dependent upon a freak production for permanent betterment. The hen that combines a good egg production with the ability to lay a properly shaped, colored and fertile eggs is of far greater breeding value than the highest producing hen if she lays small, misshapen, off-colored eggs and shows a low fertility and hatchability in her eggs. The man fortunate enough to possess a hen that combines both very high productive abilities with all of the other necessary breed qualifications possesses indeed a jewel of great price. Her value as the foundation stone for a strain of as good as she, cannot be estimated in dollars and cents. The eggs and chicks of such a hen could not be purchased for any price, for a number of generations at least. And yet we are greeted with announcements that we can buy the eggs from the highest producers and at a pretty reasonable price, too. There is something wrong somewhere, evidently.

Of course, for advertising purposes the phenomenal layer is valuable. But that is a different thing from her breeding value to the man purchasing her eggs in good faith in her ability to produce like for him. This publicity permits the owner to sell all of his stock, whether it is excellent, good or just fair, at a much higher price than he would otherwise receive—purely because of the possession of the great layer. But from a breeding standpoint she is not always worth what her eggs are cracked up to be.

All honor and glory to the men who are able to produce the 300-egg hen. May they live long and prosper. When we are afforded the privilege of talking to those who have actually created such layers we come away with the feeling of having been in the presence of a master. And if asked, these gentlemen usually admit freely that they cannot guarantee that their hens will do as well in the second or third generation. They know the difficulties, the pitfalls and the innumerable unlooked-for elements of uncertainty that beset the breeder of high producers. They realize the impossibility of guaranteeing anything along breeding lines. But it is the fellow who purchases such birds and then exploits their records for the benefit of his purse who does the damage. "I bought eggs from Lady So-and-So, and I didn't get nearly as good pullets," is a common expression, if one goes through the highways and byways of poultrydom.

A Straight Draught Without Any Turns

Cantleak Chimney Flange
Patent Applied For

can be set up on any roof and it will give you straight draught, from your fire up thru your chimney, and a straight draught without any turns is what you want to keep a fire going properly.

Lord Farms, the inventors and manufacturers of the Cantleak Chimney Flange, have been experimenting for a number of years and at last have found the way to obtain a straight and steady draught for the coal burning brooders and mammoth incubators, or wherever a fire is used in an out building.

No wire stays to support chimney—easy to slip it into place and it will stay there. Takes less than two minutes to set up and take down. Write today for one and forget your chimney troubles.

Comment on Standard Changes.

(Continued from page 643)

be explained here, and I will, therefore, refer to certain men who are known to most of the readers. At Purdue University we have three men who are doing more real hard thinking, and getting more tangible results than are being secured at any one agricultural college in this country. In Messrs. Phillips, Jones and Carrick we have a trio of investigators who are working together and getting such results as to attract the admiration and warrant the respect of every poultryman in America. But these boys know their work is not ready for standardization; it is still experimental. Some things on which great hopes were originally founded have already had to be abandoned and the investigations started anew along entirely different lines. So great has been the progress of this college, however, that at the last state meeting of the Indiana Poultry Association we assured the college faculty that we would use our influence to secure such additional appropriation from the Legislature as would be necessary to enable them to continue this work in an adequate manner. This money has been secured and we may look to this bunch of live wires for real results, but they will not be accomplished in a year, in fact if results of permanent value to the industry are achieved in ten years we will feel it was the best poultry investment the State ever made.

Utility Classes in the Shows.

I have been criticised by some for going as far as I have in promoting the utility classes in the exhibitions under my management. I have had a double object in view. I believe the utility men have advanced far enough to warrant these classes, in fact they have advanced to the point where they need help from the public. These classes are educational but not in the sense that statement is generally taken. They are the basis for a lot of real information for the public, but it is not the public in which I am alone interested, but also the college men themselves. At the demonstrations, questions are being shot from all directions at the instructors, and it is from these questions, together with the actual experience of the men and women in all walks of life, that our college men need and from which they are able to learn. In fact, the utility class at the Coliseum Show was provided to educate the educator and not the public.

It was not my intention to give away my hand just yet, but the matter has reached such a serious stage, with the recommendations of the Committee of Forty that I feel the public should know what I am trying to do, and if it takes a little of the wind out of the sails of the college boys they will stand for it, for they do want to learn, and they do not want to put any one on the wrong track.

In the editorial on the "Fate of the Standard," in May A. P. J., Mr. Platt says that I have not been in accord with the Committee of Forty, which is true. I have no grievance with any member of that committee, and am willing to grant to them the same rights I expect for myself. If any three of them who are qualified, had been named as the revision board I would respect their appointment and not try to tell them how to run their own business. If E. C. Branch, Henry Schwab and the writer, as members of the Revision Committee, are not qualified to revise the Standard, then name men who are, and I know the other members of the committee as well as myself will abide by your decision. But if we are qualified, if we can give you a real Standard, if we can, after years of experience and with the best thoughts of a life time, give you the worth of your money, then it is up to us to do it without dictation from a lot of men with personal hobbies to ride.

How to Revise the Standard.

If we need additional help in this work you owe us the courtesy of allowing us to select that help. But, I know that with the addition of an editor to go over the detail there is no need for a larger committee.

Mr. Platt knows what the results of the big committee were at Indianapolis at the last revision of the Standard. I was not named on the revision board but was finally called in to stop wrangling and try to bring order out of chaos. The revision committee had been in session for three days and had reached nowhere; they were all split up and a part of them were ready to fight.

W. C. Pierce finally came to my office and said: "For goodness sake, Dad, come over and help us get out of the tangles or we will have to adjourn without doing anything." By the time we had the work under way one after another of the members of

ROGERS WHITE LEGHORN FARM—F. D. Rogers, Owner—South St. Road, ELGIN, ILL.

the committee had to go home, and the whole job was finally thrown over to W. C. Pierce, E. C. Branch and myself. We spent one-half day trying to harmonize the opinions of the different members as outlined on the tally sheets but finally junked the whole works, took the letters from the specialty clubs, together with such suggestions as were mailed in by prominent breeders, and started in on page one of the Standard and went through the book. We made up a type written copy and forwarded it to Arthur Smith to edit; and that is the Standard of today, which has received less criticism than any edition in the past 30 years.

Since 1888 I have been connected with revision work, and since 1893 there has never been a committee reported on revision unless I was a member of the committee, or a member of the general committee that accepted their report. No other one member of the A. P. A. can say this much. I have served on general revisions with the best informed breeders in this country, including such men as Philander Williams, B. N. Pierce, Sharp Butterfield, and others whom it is a credit to any man to have known, and I can say that at no time or place has your revision committee ever adopted a Standard for any breed or variety without giving the most careful consideration to the commercial value of that breed or variety. How well we have done our work is proven time and time again by the winners in the world's greatest egg contests.

Now to tear down this work and start out on new lines with untried plans would, in my opinion, be the undoing of the American Poultry Association.

In the past the principle trouble that we have experienced in trying to give the fanciers a real Standard, has been due to the so-called hobby or strain cranks, who, through selfish motives, were trying to have the Standard framed to suit their personal aims or their own birds, regardless of how it might affect others; and it is this very thing you can avoid with the smaller committee. If the report is true that the last revision of the Standard cost \$13,000 then more than 50 percent of the money was wasted. I know the expense of the four men who did the real work, together with the stenographic report, was less than \$600.

Mr. Hewes Is Ready to Resign.

If you will allow your revision board to take over this revision work and will follow the advice given in our report, which you adopted at Kansas City last August, which provides that our Standard Committee shall meet and remain in session until their work of revision is completed, and will grant this committee the power to finish the Standard, they can do the work, including the publishing of the book, inside of 90 days. This can be done, including the printing of 5,000 copies of the Standard, for less than \$10,000. But if you are going to have short sessions, where the committeemen are charging up car fare, and then have to have Tom, Dick and Harry butt in on the work after the copy is completed, it may cost you \$20,000.

If you will put confidence in your Standard Committee, and in your newly elected president, I as one member of the committee will guarantee to have the finished Standard in the hands of the poultry press in less than 120 days from the day the committee meets. I will further guarantee to give the fanciers a Standard that will be satisfactory to the men and women who have made the business what it is.

But if at the meeting in Seattle the convention instructs the Standard Committee to proceed with the issuing of a new Standard book on the lines laid down by the Committee of Forty; if the convention after listening to the usual wind-jamming and outbursts of school boy oratory, authorizes a Standard that is to be an illustrated Museum of Anatomy, with a slaughter house and a dissecting room thrown in for good measure, I serve notice on our newly elected president, Mr. Rigg, to be prepared to accept my resignation from the Standard committee and revision board the minute such motion prevails. I do not know how Mr. Schwab or Mr. Branch may feel about it, and am only speaking for myself, but I am a fancier first, last and all the time; I am for the beautiful, without injuring the useful.

Possibility of a New Breeder's Association.
I am risking entirely too much money in the promotion of poultry exhibitions to be a party to tearing down the very thing it has taken the fanciers 50 years to build. And I give it as my candid opinion that if a motion prevails at Seattle to adopt the report of the Committee of Forty, it will mean the introduction into the field of another national association and the death of the A. P. A.

We have been traveling too long on theories; we must get back to common sense.

J. H. REED & SON
PARIS, ILLINOIS

We have an association that under ordinary business management should pay annually 10 percent on \$50,000. The money we have spent in the last 20 years, from which no real value has been derived, would have created a sinking fund of which the interest alone would pay all running expenses.

The A. P. A. is blessed, or cursed, with orators, men who can and do sway the conventions.

If you could only see the records of money that has been voted out of the treasury on motions after long-winded speeches had ostensibly mesmerized the delegates, you would wonder that we exist as an organization. If we had a real business head, a man of brains in charge, we would be better off if we did not hold a meeting again in five years. I do not claim these men who sway the conventions are dishonest. They are simply visionary, and in trying to swing a convention they unintentionally mesmerize themselves into believing the suggestions which they are offering are for the best interests of the business.

The members in general are sick and tired of it. They want these men to get out or desist in their efforts. Just as sure as we continue along the lines we have been following for the past few years, where a handful of wind-jammers have everything to do with the management of affairs, just that sure are we standing in imminent danger of an earthquake; and you will wake up some fine day to see a new and a greater association staring you in the face, and a real Standard for judging adopted by real fanciers; and I can name no less than six of America's best shows where this new Standard will be recognized.

It is up to you boys on the Pacific Coast to see that the old boat has one more chance to float. You may not know there already has been hard work on a part of some of your members to keep this new association from springing into existence more than a year ago, but just as sure as we tear up the only asset we have, the American Standard of Perfection, just that sure the deal will go over.

A New Revised Chapter on Production.

By W. R. Hunt.

I have just received my copy of A. P. J. for May, and have read your editorial on the revision of the Standard, and it has interested me very much.

Now, Mr. Editor, this Standard of revision business seems to be bothering you considerably, and it did bother me for a while, but I have studied out a final chapter for the Standard, a chapter to come after the bed-bug chapter, the mite and louse chapter and the egg and meat chapter.

This last chapter is to be a brief summary of preceding chapters and to contain a program for the yearly progress which is to be made from 1923 to 1931, so that breeders may have a calendar or schedule to regulate their progress. This chapter is also to lay down the exact methods to be pursued in revising the Standard in 1931, and offer some suggestions for licensing judges.

Now, Mr. Editor, if you publish this, or offer it to "The Committee of Forty" for consideration, someone may get personal and say that I am not a member of the A. P. A. and that I have, therefore, no right to write

a chapter for the Standard. But I have raised and helped to raise poultry for the past twelve years; can also say I have been working on a 365-egg strain of utility fowls, but last year was lap year and the blamed things laid 366 eggs, so I will have to wait another year before advertising them, for I do not yet know whether I have a 365 or a 366-egg strain.

I also caught a fish once that weighed 19 pounds and was 35 inches long; and in addition to all that I once helped to trade a nice "7-year-old" horse that had roamed this old world for about 23 winters. So you see I have a right to a front seat with the utility poultrymen and the privilege of writing a chapter for the Standard.

The Chapter.

Preface—It is the purpose of this chapter to give a brief summary of preceding chapters and to declare the ideals for which breeders are to work year by year, to the year 1931; to offer suggestions for licensing judges; and to declare the methods to be pursued in revising the Standard in 1931.

Introduction—It having been shown in the preceding chapters of this Standard that anything is possible for the utility poultry breeder provided he pursues the right methods of feeding, uses trap nests and keeps his own records; and as the various lice, mites, bugs, and insects that infest poultry and poultry houses have been described in the chapter relating to these subjects; and as the Committee of Forty have been kind enough to point out to the poor old fancier that he did not even know the meaning of the words, "Standard of Perfection," since the Standard has heretofore described only a bird in show condition as the ideal bird, when in reality the perfect utility bird is the molting bird in rags and tatters with a few nice pin feathers to help its appearance, and infested with a few nice Standardbred lice and mites; and inasmuch as the poor old deluded fancier has always looked at feathers as his ideal, it shall be our duty to show him the error of his ways.

Part I—The program from now until the year 1931 shall be arranged as follows: First, as Theo. Hewes and E. C. Branch have refused to attend the meetings of the Committee of Forty, and by so doing have proved that they are not up to the standard as American citizens, since American citizens are gullible, bite at baited hooks and love to be humbugged; and inasmuch as the said Hewes and Branch have exhibited none of these qualities, but insist that they have rights as members of the Standard Revision Committee, it is now deemed necessary to eliminate these two men from American poultryry; therefore we hereby direct that they be transported to some uninhabited island so the interest of utility poultry will not be interfered with by these two men. This removal shall be accomplished as soon as possible.

Program—That there may be definite progress during the eight years this Standard is to be in effect, we will state the things to be accomplished each year, as follows:

1923. Resolved that the Rocks, Wyandottes, Reds, Orpingtons and Leghorns are the utility breeds, and all other breeds are fancy breeds and not worthy of notice; therefore we will distinguish them from now on as utility and fancy, respectively.

Utility Classes—And, furthermore, as there have never been enough first prizes offered in the utility breeds, they shall be classified

STURDY as OAKS

Stock raised from "Famous" eggs grows into fine, sturdy birds—heavy layers, prize winners of unusual beauty. It takes rugged vitality to stand the strain of persistent laying—the four seasons through—and my stock is basically hardy and vigorous.

The yearly opportunity invites you! The opportunity to buy eggs for hatching at reduced prices during my

Annual SUMMER "SAIL"

This special "sail" permits you to make a start with thoroughbred stock for a small amount of money—or to rejuvenate your flock at a modest investment.

Drop me a postal right away for the special circular.

Ancona Club

as follows: the Fancy class shall be composed of old-fashioned birds bred according to the present Standard; the modern classes to be designated as the Molting Utility class, the Pin Feather Utility class, and the Full Feather Utility class; and since fighting lice and mites is work too hard and strenuous for many utility men, and as these men are good fellows and entitled to blue ribbons, we shall also provide a Lousy Molting class and a Lousy Pin Feather class; also mitey classes are to be scheduled the same as lousy classes. This will give everybody a chance to win a blue ribbon, but for fear some persons may take unfair advantage of these new classes it shall be specified that all fowls infested with parasites must be infested with lice or mites that score not less than 80 points according to the chapter on lice and mites.

Physiological Changes.—Furthermore, be it resolved that as meat and eggs are the only useful purposes for which fowls can be bred, we will arrange our breeding plans as follows: first, as feathers, shanks, comb, wattles and bill serve no useful purpose, since they cannot be eaten as poultry meat, they shall be eliminated by a system of careful breeding, giving us chickens without feathers, that stump around on their drumsticks, and that have a mouth in place of a bill, similar in shape to a Badger dog's mouth.

Reproductive Function of the Domestic Fowl.—Second, as the digestive tract of our present chickens takes up space which should be used for egg production, we will breed chickens that have but one small intestine running fore to aft, and being about eight inches long and about the size of a pencil; the rest of the inside anatomy to be used for manufacturing eggs.

Influence of Domestication and Breeding.—Third, as each breed should serve a definite utility purpose, we will further modify the utility breeds as follows: Wyandottes shall be bred for fries, and by feeding them heating food and a little lard, and exposing them to the heat of the sun they will be naturally fried by the time they reach about two pounds in weight. Leghorns shall be fed heating food so they will lay boiled eggs. Rocks shall be fed like Wyandottes, but not exposed to as much heat, that they may continue to grow and make roasted chickens. Orpingtons shall be fed lard and heating foods, also shell-making material, and water well boiled, so they will lay fried eggs. Reds are to be kept for the production of raw meat and eggs. By this arrangement everybody can have exactly what they want.

Intensity, Rhythm or Cycle of Progress.—In 1924 all fancy breeds are to be eliminated from the Standard, and any person caught breeding them after this date shall be hanged, and his property, both personal and real, confiscated by the A. P. A.

In 1925 the fancy classes of the utility breeds are to be abolished.

In 1926 classes are to be made in the shows for the new featherless chickens, developed in accordance with previous paragraph on physiological changes.

In 1927 ribbons are to be offered for different colored eggs, and any person who does not stand spellbound in admiration of said eggshells shall be fined \$50.

In 1928 classes are to be made for the boiled Leghorn eggs and the fried Orpington eggs.

In 1929 classes are to be made for the roasted Rocks and the fried Wyandottes.

In 1930 steps shall be taken pursuant to a general revision of the existing Standard and publication of a new edition of the Standard. The work of revision shall be undertaken as follows: A committee of twenty wise men instead of forty is to be appointed as a Standard Revision Committee, as it has been found that forty men are too many to have on a committee, as fanciers are liable to slip in on a large committee and spoil the plans of the utility men. It is, of course, greatly to be hoped that all fanciers will be dead by 1930, but for fear some should be living, it is hereby specifically stated and unalterably provided that said committee of twenty shall be selected as follows: five are to be men who have bred fowls with flock averages of 365 eggs per year, five are to be fishermen who have caught 16-pound trout, five are to be horse traders, and five are to be clowns from any reliable circus. This committee shall meet in 1931 and revise the Standard.

Illustrations.—The following illustrations are to be used for this chapter on production: first, the Jungle fowl shall represent the first stage of development in modern fowls; second, the fancy fowls as described in the present Standard shall be permitted to represent the primitive stage of poultry breeding; third, the rag-and-tatter molting, lousy, utility fowls shall represent the 20th

STURDY as OAKS

Order "Famous" baby chicks while summer prices prevail. This fall, late, the pullets will be laying—and you'll have a flock of which you may well be proud. The "great oak" sturdiness of my thoroughbred beauties carries them through the most severe winter weather. During the keenly cold months they make some of their best laying records.

With the coming of summer I hold my

Annual SUMMER "SAIL"

and in a few weeks receive, at special prices, orders enough to take all the balance of my hatching eggs and baby chicks. Early request is necessary if you would be sure to secure yours. A postal brings the special circular.

Reduced to Half Price. DeLuxe Now \$5 per 15; Exhibition, \$5 per 30

WILLIAM N. OTTO, 5019 CENTRAL AVE., INDIANAPOLIS, IND.

century epoch of wisdom; fourth, the fowls without comb, wattles, bill, shanks or feathers, also the fried Wyandottes, the feasted Rocks, and the boiled-egg laying Leghorns and the fried-egg laying Orpingtons shall represent the idealized or final stage of development. Be it further provided that all college professors who have brought about this millennium in poultry breeding shall have their own pictures, names and biographies recorded in said Standard of Perfection.

Judging.—Now a word about instructing and licensing judges who are to interpret and apply the Standard. Beginning with 1923, all applicants for judge's license shall be required to pass an examination which shall be conducted as follows: The applicant is to be led before four coops, one containing chickens, one turkeys, one ducks, and one geese; and the applicant must be able to tell which are the chickens and which are the turkeys. Upon satisfying the committee of his ability to correctly name the chickens and turkeys, the applicant shall be granted a license by the A. P. A., same being duly signed by the president and the secretary, and said applicant shall thereupon be duly qualified to judge all breeds of chickens and turkeys at all poultry shows.

Be it further provided that in case applicant is able to distinguish and correctly tell which of the water fowls are ducks and which are geese, he shall be granted a general judge's license.

In case this test proves too severe, and some good fellow is not granted a license on account of failure to pass the examination, a second test shall be conducted as follows: The applicant shall be led before two coops, one to contain a chicken and the other a pug dog, and the applicant shall be required to point out the chicken and distinguish it from the dog. Any applicant failing to pass this second test shall not be granted a license to judge.

This being the last clause of the last chapter, the Standard is hereby ended.

Now, Mr. Editor, you see this simplifies matters a great deal.

DUAL POULTRY STANDARDS.

By J. H. Drevenstedt.

[NOTE: Mr. Drevenstedt has often been referred to as "the strong arm of the American fancy." He edited the Standard of Perfection, edition of 1898. For thirty years he has been one of the headline judges of the great eastern shows. The following article by Mr. Drevenstedt appeared in the May 14 issue of the American Poultry Fancier, a weekly poultry paper published by W. B. Atherton, secretary of the Boston Poultry Show. Mr. Drevenstedt is the leading editorial writer on the Fancier.]

The American Standard of Perfection is the American Poultry Association. To the former the latter owes its existence today. It is the A. P. A.'s chief stock in trade. Without it, the prestige of the old organization would be nil, for it is the only binding tie that holds its members together and in accord with the fundamental principles of the American Poultry Association laid down by its founders many years ago.

Article II of the Constitution and By-Laws as amended and adopted at the twenty-second annual meeting of the American Poultry Association at Boston, January, 1898, reads as follows: "Section I. The object of this Association shall always be for the perfection of the American Standard of Perfection, which shall be exclusively the property of this Association; and to consider and discuss all matters of a national character regarding the poultry interests at large."

The creed of the founders as embodied in that vital section, Article II, is the keystone of the A. P. A. structure. Subsequent changes and amendments, to all intents and purposes, have not vitiated it in the minds of modern breeders and fanciers, whose first thought and consideration are the welfare of their respective breeds or varieties. So long as breed standards are made by and for intelligent and progressive breeders of poultry, so long will the American Poultry Association hold its membership together, and no longer.

Breed type and color properties are the result of years of careful selection by fanciers whose ideals should prevail, if our breeds and their subvarieties are to progress and endure. Literally, the Standard is the safe deposit for each and every variety of poultry recognized by the A. P. A., and none but breeders should hold the key to that safe.

We are led to make the above remark after reading the leading and important editorial, "The Fate of the Standard" in May American Poultry Journal, from which we

Kill Rats by Science

Europe Has Employed this Scientific Method for Years—Great Ocean Ships, Big Warehouses, Grain Elevators, Huge Farms Have Been Rid of Rats and Mice in this Way.

Now introduced in this country under the name of Reefer's Rat Viro. Used with tremendous success. Users astounded by its efficiency. Read what they say! Their successful experiences can be yours. Do as they did and you will not have a rat left on your place.

Will Never Be Without It

Plain Dealing, Iowa, Dec. 30, 1920.
Dear Mr. Reefer:
I have used your wonderful Rat Viro. It cleared my house of rats. I will never be without it. Faithfully yours,
K. L. BURDEN

No Rats Left

Accord, N. Y., Dec. 21, 1920.
Dear Mr. Reefer:
Since using your Rat Viro, I have seen no live rats. Yours truly,
HOWARD GRAY

These are only a few of the letters dipped from the daily mail. We have thousands of others even more enthusiastic. Each one brings out the fact that Reefer's Rat Viro kills rats without fail.

New Discovery Not a Poison

Bacterial concentrate discovered by noted French scientist. Banishes traps and poisons. An entirely different method. Sure death for every rat, mouse and gopher—absolutely harmless to humans, pets, poultry and live stock.

Rats Die Outside

VIRO forces rats outdoors seeking water. No rotting odor. No rats to kill. Only perfect rat killer invented. Approved by highest scientific authorities. Sure death. Safe. Simple to use.

Free Trial!

Use Reefer's VIRO, and if there's a single rat or mouse left on your place you can have your money back. Trial will cost you nothing if you are not satisfied. Isn't that fair? Don't wait. Rats cost you money every day you delay. Accept this square deal offer.

Send Coupon NOW!

Don't delay. Fill out coupon and mail. For \$1.00 we will send you enough VIRO to clear big barn or house of rats and mice. Send for it! Try it! Satisfactory results guaranteed. Every rat killed means \$10 saved. Get rid of rats. Here's your chance. Mail coupon!

All Right

Houston, Texas, Dec. 17, 1920.
Dear Mr. Reefer:
The Rat Viro you sent me is all right. Yours, JOHN VIEZ

Wonderful!

Centerville, Iowa, Dec. 20, 1920.
Dear Mr. Reefer:
Your Rat Viro is wonderful. I used it only 2 nights and now I cannot hear any more rats. Before I got your Rat Viro I could hardly rest at all. Rats and mice seemed to have the house to themselves. Yours truly, H. STEWART
